## 1 Introduction

- 1.1 A hybrid planning application (Ref. 22/00434/F) (the Application) was submitted by Weston Homes (the Applicant) to Norwich City Council (NCC) on 1st April 2022 for the comprehensive redevelopment of Anglia Square and various parcels of mostly open surrounding land, (the Site), as shown within a red line on drawing 'ZZ-00-DR-A-01-0200'. The Application comprised a full set of technical documents to assess the potential impacts of the proposals, including an EIA which covered a number of topics. In respect of SuDS Drainage Strategy, this was described and explained in the Surface Water Drainage Strategy Report (Rev B dated 01.04.2022). Please refer to the original documents for further details.
- 1.2 Application Ref. 22/00434/F follows a previous application on a somewhat smaller development parcel, (NCC Ref. 18/00330/F) made jointly by Weston Homes Plc as development partner and Columbia Threadneedle Investments, (CTI), the Site's owner, for a residential-led mixed use scheme consisting of up to 1,250 dwellings with decked parking, and 11,000 sqm GEA flexible ground floor retail/commercial/non-residential institution floorspace, hotel, cinema, multi-storey public car park, place of worship, and associated public realm and highway works. This was subject to a Call-in by the Secretary of State (PINS Ref. APP/G2625/V/19/3225505) who refused planning permission on 12<sup>th</sup> November 2020, (the 'Call in Scheme').
- 1.3 Following submission of the Application Ref. 22/00434/F, and completion of the statutory consultation exercise, the Applicant has worked with NCC to review the consultation responses received from the local community, statutory consultees and other key stakeholders, so as to identify an appropriate response where considered relevant. As a result of consideration of these comments, as well as ongoing discussions with NCC, a number of changes to the Application as originally submitted are now proposed, including the reduction in height by 1 storey of Blocks A and D; realignment of basement and ground level car park accesses to Block A; repositioning of houses and apartments forming Block B; amendments to the housing mix; raising of Block C ground level to above 100year (+climate change) flood levels; distance between Block C and 4-10 Beckham place increased; elevational changes and repositioning of Block L (Stump Cross building); roof ridge and eaves on east side of Block M reduced in height; introduction of 2 storey podium between Blocks E and EF to provide larger car park; proposed crossings on Edward Street (opposite Beckham Place) and Pitt Street (by Tooley Lane removed; and landscape amendments. These changes comprise the Amended Application submitted in July 2022. Overall, the Amended Application continues to seek consent for up to 1,100 dwellings and up to 8,000 Sqm (NIA) non-residential floorspace and associated development. However, since the amendments result in minor changes to the full development description, an updated version of the full Amended Application description is contained in **Appendix A**.
- 1.4 The update to the Surface Water Drainage Strategy Report (Rev A Submission) sets out where necessary a response to the drainage related comments received on the Application as originally submitted, then describes how the design has been developed and adapted as a result of these and other comments, and finally considers the implications of the changes to the scheme now proposed.

- 1.5 A separate report, undertaken by Royal Haskoning DHV, deals with the flood risk assessment, hydraulic modelling study and impact assessment and should be read in conjunction with this report.
- 1.6 The Application Description and Location Plan are contained in **Appendix A**.
- 1.7 The proposed Outline/Full Planning Application Boundaries and Development Proposals are contained in **Appendix B**.
- 1.8 The changes in the Amended Application arising from the drainage related comments are summarised in the Table 1.0 below:

| Consultee Comment                                                                                                                                                                                                     | Response From Project Team                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Norfolk County Council - Lead Local Flood Authority<br>As per letter dated 26 <sup>th</sup> may 2022 – LLFA Ref: FW2022_0423                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1. An updated Flood Risk Assessment (FRA), Drainage Strategy and Hydraulic Modelling Study that consistently provides information that interlinks each of the documents.                                              | Cross-references have been added throughout this document where appropriate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2. Within the FRA, Drainage Strategy, Hydraulic Modelling Study and yet to be developed detailed drainage design, we request these documents incorporates the evidence to address the issues identified in the Annex. | <p>The issues identified in the Annex are, largely, included within the following itemised comments and are addressed as follows. Other items in the Annex raised include:</p> <ul style="list-style-type: none"> <li>- <i>The site is within the River Wensum area and is subject to requirements relating to maintenance of nutrient neutrality.</i> This is being addressed by Others and a report shall be submitted in Rev A Submission.</li> <li>- <i>LLFA notes there is reference to Table 3, yet there is no Table 3.</i> There is no reference to Table 3 in this Drainage Report.</li> <li>- <i>Calculate greenfield and brownfield run-off rates using the latest datasets and hydrological methods.</i> The modified rational method was used to calculate brownfield runoff rates to be updated to FEH. It should be noted that Anglian Water have accepted a proposed maximum outfall rate of 242 l/s and the proposed drainage strategy meets this requirement.</li> <li>- <i>LLFA disagree with the accuracy of the sewer catchments defined in Appendix F stating that permeable areas shown are unlikely to be permeable.</i> The assessment undertaken by the LLFA would likely result in the existing brownfield run-off from the site increasing in rate and volume. The calculation undertaken is therefore conservative as it considers gravels and green areas as permeable, whilst the LLFA assessment would consider these as generating runoff.</li> <li>- <i>NPPF in para 4.1 incorrect</i> – this has been updated</li> <li>- <i>Evidence to support infiltration is not viable due to contamination and high groundwater.</i> The Royal Haskoning FRA report refers to borehole data which describes a</li> </ul> |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>groundwater level of 3m bgl which was taken in May 2022. As this level was taken in drier months, it is considered likely that the water table will be elevated in the winter months. Considering that the base of a soakaway is to be 1m above the highest groundwater level (in accordance with CIRIA SuDS Manual, it is not possible to achieve this whilst also achieving suitable cover above the soakaway.</p> <p><i>-Residual risk of surface water pumps</i> – This has been addressed, see below.</p> <p><i>- Inconsistencies with Landscaping layout vs SuDS Layout regarding Green Roofs</i> – Proposed green roofs for the Full Planning Application areas are clearly identified.</p>                            |
| 2.1 The assessment of the greenfield and brownfield rates and volumes are required to be calculated accurately using the FEH in accordance with the LLFA Developer Guidance requirements and presented clearly and consistently within the technical reports.                                                                                                                                                                                                                                                                                                                            | The hydraulic model prepared for the Surface Water Drainage networks serving each catchment area now include FEH rainfall data as requested. See hydraulic model outputs in Appendix J of this report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2.2 Provide evidence to support the justification of increasing the greenfield discharge rate is required in accordance with the LLFA Developer Guidance.                                                                                                                                                                                                                                                                                                                                                                                                                                | The site is Brownfield and currently drains unrestricted and untreated into the existing Anglian Water surface water sewers which cross the site. As the site is Brownfield and practically 100% impermeable, it is not considered reasonable or appropriate to apply greenfield run-off rates for this Application. Anglian Water state that where this is not practical they will assess capacity based on the 1:1 year calculated rate. They therefore permit a maximum discharge rate of 242 l/s to manage all storms up to and including the 1:100yr + Climate Change Event. A Pre-Development Enquiry and Capacity Check from Anglian Water confirming this is contained in Appendix I of this report.                     |
| 2.3 Apply the latest (May 2022) Climate change guidance, which would require the application of a 45% climate change allowance to the 1% AEP and to apply the appropriate climate change allowance of 40% to the 3.3% AEP calculations.                                                                                                                                                                                                                                                                                                                                                  | The hydraulic models prepared for the Surface Water Drainage networks serving each catchment area now include the up-to-date Climate Change Allowances as requested. See hydraulic model outputs in Appendix J of this report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>2.4 Evidence that recent liaison with Anglian Water relevant to this new planning application that provides:</p> <p>2.4.1 confirmation from Anglian Water that no changes have occurred in the public network since 2017.</p> <p>2.4.2 Obtain recent drainage assessment from Anglian Water that relates to the current proposed development.</p> <p>2.4.3 Provide current set of DG5 records from Anglian Water.</p> <p>2.4.4 provide evidence of an “agreement in principle” with any third parties taking on surface water drainage management and maintenance responsibility.</p> | <p>2.4 Up-to-date sewer records have been obtained and an up-to-date pre-development enquiry has been received. Any adopted sewer or diverted adopted sewers within the red-line boundary shall be the responsibility of Anglian Water.                                                                                                                                                                                                                                |
| 2.5 Provide a more in-depth consideration and assessment of rainwater harvesting and re-use opportunities.                                                                                                                                                                                                                                                                                                       | See Section 4 para. 4.6 and 4.7.                                                                                                                                                                                                                                                                                                                                                                           |
| 2.6 Provide a more in-depth consideration and assessment of groundwater flood risk.                                                                                                                                                                                                                                                                                                                              | Addressed in Royal Haskoning DHV FRA Report.                                                                                                                                                                                                                                                                                                                                                               |
| 2.7 Provide a more in-depth consideration and assessment of sewer flood risk.                                                                                                                                                                                                                                                                                                                                    | Addressed in Royal Haskoning DHV FRA Report.                                                                                                                                                                                                                                                                                                                                                               |
| 2.8 Provide clarification on the retention of surface water runoff on the site and whether this is actually the provision of either blue or green roofs not previously included in the surface water drainage calculations.                                                                                                                                                                                      | No blue-roofs are proposed on site. Green-roofs are to be provided. In terms of drainage calculations. It is considered robust to assume green-roofs are saturated and will not provide any attenuation for large storm events. As such, the 1:100yr + Climate Change hydraulic modelling assumes all roof areas are impermeable. This provides a conservative assessment of required attenuation volumes. |
| 2.9 Provide clarification on the water depth for the return periods given at Edward Street Service Yard as there are significant discrepancies.                                                                                                                                                                                                                                                                  | Addressed in Royal Haskoning DHV FRA Report.                                                                                                                                                                                                                                                                                                                                                               |
| 2.10 Prepare and provide a full detailed drainage design that includes all the proposed elements of the surface water management system. This includes clarification of the design details (including plans, modelling, calculations and supporting information in accordance with the LLFA's Developer Guidance) of suitable drainage featured, such as green/blue roofs, bio-retention features and tree-pits. | See Appendix K.                                                                                                                                                                                                                                                                                                                                                                                            |
| 2.11 Provide the proposed discreet drainage catchment areas and supporting information on a plan for each of the proposed systems in accordance with the LLFA Developer Guidance.                                                                                                                                                                                                                                | See Appendix K.                                                                                                                                                                                                                                                                                                                                                                                            |
| 2.12 Undertake an assessment that demonstrates how the proposed SuDS systems meets the four pillars of SuDS in accordance with the LLFA Developer guidance and in relation to Policy E9 of the Local Flood Risk Management Plan.                                                                                                                                                                                 | See paragraphs 5.4, 5.9, 5.13 and 5.16.                                                                                                                                                                                                                                                                                                                                                                    |
| 2.13 Undertake a further assessment and consideration of the carbon impact of additional pumps operating on this site is recommended in accordance with Policy E8 of the Local Flood Risk Management Plan.                                                                                                                                                                                                       | A further assessment of the carbon impact of pumps has been undertaken by the M&E Engineer and is included within their report.                                                                                                                                                                                                                                                                            |
| 2.14 Prepare a surface water drainage phasing plan for the development.                                                                                                                                                                                                                                                                                                                                          | Weston Homes have provided a Draft Phasing Strategy document which is included in the Rev A Submission. This shows the following blocks to be delivered in each phase.<br>Phase 1 = Block A, B, C, D and M<br>Phase 2 = Block K/L and J3<br>Phase 3 = Block H, G and J<br>Phase 4 = Block E and F                                                                                                          |

|                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                                                       | <p>The proposed drainage strategy allows for Blocks B, C, D, E, F, G, J and H to be managed by stand-alone drainage systems that do not rely on other phases to be built.</p> <p>System 4 managing Blocks A, M, J3 and K/L shall be delivered in Phases 1 and 2 and as such it is anticipated that a temporary drainage network, comprising as much of the designed drainage for Block A and M shall be installed in Phase 1 and shall be linked with Block K/L and J3 in Phase 2. As these phases follow each-other, it is considered suitable to allow for one drainage system to cover two phases.</p> |
| 2.15 Provide updated water quality assessment information that acknowledge the inclusion of all elements of the SuDS system.                                                                                                                                                                                                                                                          | See Section 4 showing water quality treatment features for each catchment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2.16 Provide further information regarding the water quality management approaches required for the construction of the proposed development                                                                                                                                                                                                                                          | See Section 7                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2.17 Identify and assess the residual risk and provide suitable mitigation associated with the management of pumps and the attenuation tanks.                                                                                                                                                                                                                                         | See paragraphs 4.75 to 4.77.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2.18 provide a site layout plan that demonstrates all surface water drainage features sized appropriately and to ensure suitable space is available within the proposed development The design should be in accordance with both the LLFA Developer Guidance, the Ciria Suds manual, the building regulations and other relevant local and national guidance, practices and policies. | See Appendix K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2.19 Provide detailed information of the design and operation of the flood barrier for inclusion within the hydraulic model as part of the full application.                                                                                                                                                                                                                          | Addressed in Royal Haskoning DHV FRA Report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2.20 Update the hydraulic model and the drainage strategy to ensure they are consistent with other technical disciplines' submissions.                                                                                                                                                                                                                                                | See Appendix J and K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2.21 An assessment of the surface water treatment required for all elements of the proposed development to determine whether the SuDS system is providing an appropriate amount of water quality treatment.                                                                                                                                                                           | See updated Section 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2.22 A surface water drainage design that includes a site plan with appropriately sized SuDS Features and conveyance with both the LLFA Developer Guidance and the Ciria SuDS Manual.                                                                                                                                                                                                 | See Appendix K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2.23 Identification of the structures to be placed below ground and an assessment of the risk of groundwater flooding and specific mitigation measures to manage the groundwater flood risk to those structures where required.                                                                                                                                                       | Addressed in Royal Haskoning DHV FRA Report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2.24 A Maintenance and Management Plan detailing the activities required to manage the proposed SuDS including confirmation of ownership, maintenance responsibilities and in principle agreements.                                                                                                                                                                                   | See updated Section 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 2.25 Provide an updated assessment of the suitability of the different types of SuDS components on the site.                                                                                                                                                                                                                                                                                                                                                                                             | See Table 4.1.                                                                                                                                             |
| 2.26 Provide further evidence to support the viability of the Edward Street Service Yard residual risk mitigation and provide clarification on whether an automated flood barrier could be installed.                                                                                                                                                                                                                                                                                                    | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.27 The Emergency Flood Plan should be prepared in accordance with the ADEPT guidance (2019), available at <a href="https://adeptnet.org.uk/floodriskemergencyplan">https://adeptnet.org.uk/floodriskemergencyplan</a> and demonstrate ongoing liaison with the relevant Emergency Planning Team                                                                                                                                                                                                        | Addressed in Royal Haskoning DHV FRA Report. It is understood that The Emergency Planning Team (Teresa Cannon) has confirmed that this can be Conditioned. |
| 2.28 An assessment of the potential to install some flow and level monitoring gauges to enable the site manager to monitor and manage the flood risk on site.                                                                                                                                                                                                                                                                                                                                            | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.29 Update the assessment of the residual flood risks within the FRA for the proposed development and its components.                                                                                                                                                                                                                                                                                                                                                                                   | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.30 Inclusion of an updated Exceedance Flow Routes Plan for the site with proposed finished floor levels marked on.                                                                                                                                                                                                                                                                                                                                                                                     | Figure 1 in Section 4 updated to show levels as requested.                                                                                                 |
| 2.31 Both the FRA and the Drainage Strategy require updating to address the large number of statements and conjecture that are not supported by evidence. These statements and assessment need to be evidence based for the statements to be validated.                                                                                                                                                                                                                                                  | Noted and actioned.                                                                                                                                        |
| 2.32 Provide a proposed drainage design with supporting evidence (plans, calculations, modelling and detailed design) that provide evidence of inclusion and support the proposed offsite drainage of surface water for the car park entrance and the service yard entrance on Edward Street. The evidence should demonstrate that the mitigation is appropriate, operable and “agreed in principle” by Anglian Water along with identifying who will be responsible for the maintenance and management. | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.33 Provide clarifications from the applicant on whether the inclusion of flood doors have been considered on the proposed development.                                                                                                                                                                                                                                                                                                                                                                 | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.34 Provide discussion on whether an alternative design approach and location was considered before placing the car park entrance ramp on Edward Street.                                                                                                                                                                                                                                                                                                                                                | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.35 Provide an assessment of flow entering the basement car park should mitigation not be installed or the failure of mitigation measures.                                                                                                                                                                                                                                                                                                                                                              | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.36 Provide evidence the proposed development scheme that in accordance with NPPF where “the development should be made safe for its lifetime without increasing flood risk elsewhere.”                                                                                                                                                                                                                                                                                                                 | Addressed in Royal Haskoning DHV FRA Report.                                                                                                               |
| 2.37 Address all LLFA queries given in the attached Annex.                                                                                                                                                                                                                                                                                                                                                                                                                                               | See point 2. above.                                                                                                                                        |
| 3. The hydraulic modelling report and model requires updating to include.                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                            |

|                                                                                                                                                                                                                                 |                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| 3.1 confirmation that the key parameters (URBEXT, Catchment area, etc.) have been checked and the parameters where appropriate adjusted accordingly.                                                                            | Addressed in Royal Haskoning DHV FRA Report. |
| 3.2.1 Includes sewers in the hydraulic model for the sewer network affecting the parts of the site included in this application to support the full application that demonstrates there is no increase in flood risk elsewhere. | Addressed in Royal Haskoning DHV FRA Report. |
| 3.2.2 Is extended to cover the full catchment to ensure the inflows are calculated correctly, or includes sensitivity testing showing that these inflows do not impact flood risk at the site.                                  | Addressed in Royal Haskoning DHV FRA Report. |
| 3.3 Provide clarification on whether Anglian Water has been contacted to supply sewer data. This should be requested and included where interactions with the sewer system are likely to impact flooding.                       | Addressed in Royal Haskoning DHV FRA Report. |
| 3.4 The inclusion of information regarding the onset of flooding and its associated duration for vulnerable locations across the site including the basement car park entrance and the service yard and loading facilities.     | Addressed in Royal Haskoning DHV FRA Report. |

## 2 Policy Framework and Pre-Application Comments

### Local Policy

#### Greater Norwich Local Plan

*"We are working with Broadland District Council, Norfolk County Council and South Norfolk District Council to prepare the Greater Norwich Local Plan (GNLP).*

*The GNLP will build on the long-established joint working arrangements for Greater Norwich which have delivered the current Joint Core Strategy (JCS) for the area. The JCS plans for the housing and job needs of the area to 2026 and the GNLP will ensure that these needs continue to be met to 2036.*

*The GNLP will include strategic planning policies and will also allocate individual sites for development. It will aim to ensure that new homes and jobs are delivered and the environment is protected and enhanced, promoting sustainability and the effective functioning of the area."*

- 2.1 The GNLP was submitted to the Secretary of State for independent examination on 30<sup>th</sup> July 2021. The emerging plan allocates the Anglia Square site (GNLP0506) for Mixed Use Allocation.
- 2.2 Emerging Policy: *GNLP Policy 2 would be anticipated to reduce the risk of fluvial flooding that may arise as a result of development, through the requirement to carry out flood risk assessments, and incorporate sustainable drainage measures.*
- 2.3 Emerging Policy : *GNLP Policy 2 would be anticipated to mitigate the risk of surface water flooding that may arise as a result of development, through the requirement for development to incorporate sustainable drainage measures and contribute to the green infrastructure cover.*
- 2.4 An indicative drainage plan incorporating sustainable drainage (SuDS) is included in Section 7, detailing how surface water will be managed on the site and the rationale for the approaches used. Surface water runoff from the site will be restricted as far as possible to ensure that the risk of flooding both to the site and elsewhere is minimised, taking into account the effects of climate change.

#### Development Management Policies Local Plan

- 2.5 The Development Management Policies Plan (DM policies) sets out policies which will apply across the whole city, as well as policies which apply in designated areas.

**Policy DM5** – Planning effectively for flood resilience' details the policy for flooding, sustainable drainage and surface water flooding and surface treatment. The policy states:

*"Developers will be required to show that the proposed development:*

- *would not increase the vulnerability of the site, or the wider catchment, to flooding from surface water run-off from existing or predicted water flows; and*
- *would, wherever practicable, have a positive impact on the risk of surface water flooding in the wider area.*

*Development must, as appropriate, incorporate mitigation measures to reduce surface water runoff, manage surface water flood risk to the development itself and to others, maximise the use of permeable materials to increase infiltration capacity, incorporate on-site water storage and make use of green roofs and walls wherever reasonably practicable.*

*The use of permeable materials, on-site rainwater storage, green roofs and walls will be required unless the developer can provide justification to demonstrate that this would not be practicable or feasible within the constraints or configuration of the site, or would compromise wider regeneration objectives."*

- 2.6 The landscaping of the development in terms of surface water management is also considered in Policy DM5. This states:

*"Development proposals will be required to maximise the use of soft landscaping and permeable surfacing materials unless the developer can provide justification to demonstrate that this is not feasible.*

*Where permission is required, proposals involving the provision of new or replacement paved and other impermeable surfaced areas will only be permitted:*

- *in areas of impermeable soils as identified in Appendix 1;*
- *in other areas where it can be demonstrated that permeable surfaces are not practicable due to poor soil infiltration capacity, high groundwater levels or risk of subsidence; and*
- *in areas with soils with average or good infiltration capacity, where it can be demonstrated that there is an exceptional and overriding justification for such surfaces.*

*In cases where poor soil infiltration capacity or other factors preclude the use of permeable surfacing materials, development proposals should seek to manage and minimise the impact of surface water run-off by suitable measures for water storage on-site."*

- 2.7 An indicative drainage plan incorporating sustainable drainage (SuDS) is included in Section 7, detailing how surface water will be managed on the site and the rationale for the approaches used. Surface water runoff from the site will be restricted as far as possible to ensure that the risk of flooding both to the site and elsewhere is minimised, taking into account the effects of climate change.

### **Natural England and Nutrient Neutrality Assessments**

- 2.8 In March 2022, Natural England issued a letter to Local Planning Authorities, Environment Agency and all Heads of Planning and Chief Executives to give advice for development proposals with the potential to affect water quality resulting in adverse nutrient impacts on habitats and sites. The letter provides advice on the assessment of new plans and projects under Regulation 63 of the Habitats Regulations. The purpose of that assessment is to avoid adverse effects occurring on habitats sites as a result of the nutrients released by those plans and projects. This advice does not address the positive measures that will need to be implemented to reduce nutrient impacts from existing sources, such as existing developments, agriculture, and the treatment and disposal of wastewater. It proposes that nutrient neutrality might be an approach that planning authorities wish to explore.
- 2.9 The following background is given:

*“In freshwater habitats and estuaries, poor water quality due to nutrient enrichment from elevated nitrogen and phosphorus levels is one of the primary reasons for habitats sites being in unfavourable condition. Excessive levels of nutrients can cause the rapid growth of certain plants through the process of eutrophication. The effects of this look different depending on the habitat, however in each case, there is a loss of biodiversity, leading to sites being in ‘unfavourable condition’. To achieve the necessary improvements in water quality, it is becoming increasingly evident that in many cases substantial reductions in nutrients are needed. In addition, for habitats sites that are unfavourable due to nutrients, and where there is considerable development pressure, mitigation solutions are likely to be needed to enable new development to proceed without causing further harm.*

*In light of this serious nutrient issue, Natural England has recently reviewed its advice on the impact of nutrients on habitats sites which are already in unfavourable condition. Natural England is now advising that there is a risk of significant effects in more cases where habitats sites are in unfavourable condition due to exceeded nutrient thresholds. More plans and projects are therefore likely to proceed to appropriate assessment.*

*The principles underpinning HRAs are well established. At the screening stage, plans and projects should only be granted consent where it is possible to exclude, on the basis of objective information, that the plan or project will have significant effects on the sites concerned. Where it is not possible to rule out likely significant effects, plans and projects should be subject to an appropriate assessment. That appropriate assessment must contain complete, precise and definitive findings which are capable of removing all reasonable scientific doubt as to the absence of adverse effects on the integrity of the site.*

*Appropriate assessments should be made in light of the characteristics and specific environmental conditions of the habitats site. Where sites are already in unfavourable condition due to elevated nutrient levels, Natural England considers that competent authorities will need to carefully justify how further inputs from new plans or projects, either alone or in combination, will not adversely affect the integrity of the site in view of the conservation objectives. This should be assessed on a case-by-case basis through appropriate assessment of the effects of the plan or project. In Natural England’s view, the circumstances in which a Competent Authority can allow such plans or projects may be limited. Developments that contribute water quality effects at habitats sites may not meet the no adverse effect on site integrity test without mitigation.*

*Mitigation through nutrient neutrality offers a potential solution. Nutrient neutrality is an approach which enables decision makers to assess and quantify mitigation requirements of new developments. It allows new developments to be approved with no net increase in nutrient loading within the catchments of the affected habitats site.*

*Where properly applied, Natural England considers that nutrient neutrality is an acceptable means of counterbalancing nutrient impacts from development to demonstrate no adverse effect on the integrity of habitats sites and we have provided guidance and tools to enable you to do this.”*

- 2.10 A Nutrient Neutrality Assessment is to be undertaken by others and will be submitted as part of this planning application.

### 3 Existing Site Description and Drainage Features

#### Existing Site Description

- 3.1 The site is located at Anglia Square, Norwich and consists of a shopping precinct including stores such as Iceland and Boots and a former cinema. Large office blocks are also present at the site; the disused seven-storey Sovereign House which runs north-south along Boltoph Street previously housed Her Majesty's Stationary Office (HMSO) and the under-utilised six-storey Gildengate House, built over shops underneath.
- 3.2 The existing site is almost entirely impermeable and is served by both private and adopted foul and surface water sewers. Surface water run-off is unrestricted and untreated and ultimately outfalls to the adopted sewer network to the south-east of the site.

#### Site Levels

- 3.3 A site-specific topographical survey is included in **Appendix C**. For the main Anglia Square site, levels vary between 5.09m AOD in the north west corner to 2.40m AOD at the existing access road from St Crispin's Road to the south of the site. Away from this low spot, levels in the south east corner of the site are in the region of 3.08m AOD. For the existing Anglia Square shopping centre, levels are around 3.51m AOD. The site slopes in a generally south easterly direction at a gradient of approximately 1:125
- 3.4 The parcel north west of New Boltoph Street slopes in a southerly direction, at a gradient of approximately 1:185 with the highest level to the north west of the site at 5.40m AOD and the lowest level at 5.11m AOD at the southern extent of the parcel. The site is approximately 0.35-0.4m higher than the carriageway of New Boltoph Street/ Edward Street.
- 3.5 North of Edward Street the site slopes towards the north, at a gradient of approximately 1:100, with the highest point in the south west corner at a level of 4.27m AOD and the lowest point in the north at 3.87m AOD.

#### Sewer Network

- 3.6 Sewer records, obtained from Anglian Water and included in **Appendix D**, show there to be a 675mm surface water sewer and 300mm foul sewer flowing in a south westerly direction through the site.
- 3.7 A 300mm surface water sewer and 225mm foul sewer also run west to east with Edward Street, to the north of the main portion of the site. Both sewers connect to the respective foul and surface water sewers in Magdalen Street before flowing southwards and discharging into the River between Fye Bridge Street and Whitefriars Bridge.
- 3.8 A further 525mm combined sewer flows southwards along Magdalen Street. It is highly likely that surface water flows from the Dalymond Dyke flow within this sewer, given the location of the sewer and the available information on the Dalymond Dyke.
- 3.9 The sewer locations and sizes within the site boundary are shown in more detail on the topographical survey contained in **Appendix C**.

### Pre-Development Runoff Rate

3.10 The total site area covers 4.65ha and is entirely brownfield comprising a shopping centre, office block, paved open spaces and car parks. The existing impermeable area has been measured at 4.24ha. Surface water run-off from 3.96ha is unrestricted and untreated and ultimately outfalls to the adopted sewer network within Edward Street, Magdalan Street, Botolph Street and the sewers crossing the centre of the site from west-to-east. A section of car park covering 0.28ha looks to outfall to soakaways. As such, it is not suitable to consider the runoff from the site as though it is an undeveloped greenfield site. It is therefore appropriate to use a 'like for like' approach, i.e. quantify the runoff from the existing developed brownfield site and assess it against the proposed developed site whilst providing a betterment in terms of run-off rates and water quality.

3.11 Using the Modified Rational Method detailed in Butler, D and Davies, J. (2006), Urban Drainage, 2nd ed., SPON, the surface water runoff for the existing site has been calculated as follows: -

$$Q = CiA \quad \text{where} \quad Q = \text{maximum flow rate (l/s)}$$

$$C = \text{PIMP/PR}$$

$$i = \text{rainfall intensity (mm/hr),}$$

$$A = \text{area (ha)}$$

3.12 WINDES MicroDrainage was used to assess rainfall intensities for each storm event by running each storm event and noting the peak rainfall intensity for each storm, then using the above formula, the following existing run-off rates were calculated:

- 1 in 1 year 30.99mm/hr = 350.47 l/s
- 1 in 30 year 76.03mm/hr = 859.87 l/s
- 1 in 100 year 98.68mm/hr = 1115.97 l/s

3.13 Existing run-off rates calculations are contained in **Appendix E**.

3.14 An analysis was undertaken to review the areas of the existing site which drain to the adopted sewer network. For information, this is included in **Appendix F**.

### Pre-Development Storage Volumes

3.15 A simple analysis was carried out based on the topographical survey. The various sewers serving the existing site along with the diameters are shown on the topographic survey. These were measured and the available capacity in each sewer has been calculated. This analysis identified only the private sewers which outfall from the existing development to the adopted sewers but does not include the adopted sewers themselves or any outfall pipes from gullies or rainwater pipes. It is noted that there could be additional private sewers which haven't been picked up on the topographical survey so were not included in this analysis.

3.16 The storage volume available in the pipe network serving the existing brownfield site is as follows:

- 150dia – 335.4m = 6.04m<sup>3</sup>
- 225dia -296.4m = 11.86m<sup>3</sup>
- 300dia – 71.5m = 5.08m<sup>3</sup>

- $375\text{dia} - 34.9\text{m} = 3.84\text{m}^3$
  - Assume  $1\text{m}^3$  volume for each manhole.  $30 \times \text{manholes} = 30\text{m}^3$
- 3.17 The total 'storage' volume available in the surface water sewers on the existing site is therefore approximately **56.82m<sup>3</sup>**.

#### Existing Sewers, Diversions and Build-Overs

- 3.18 The proposals will require the adopted surface and foul water sewers which cross the site to be diverted. It is anticipated that a S185 Sewer diversion Application shall be made to Anglian Water which will preclude the need for any Build-Over Agreements. Further information on sewer diversions are contained in Section 4.
- 3.19 A number of private surface and foul water sewers serve the existing site. These sewers are not anticipated to be retained as part of the proposed surface water drainage strategy and will therefore be removed and new surface and foul water sewers provided.

## 4 Proposed Drainage Strategy

### Relevant SuDS Policy

- 4.1 The NPPF states that, “using opportunities provided by new development and improvements in green and other infrastructure to reduce the causes and impacts of flooding, (making as much use as possible of natural flood management techniques as part of an integrated approach to flood risk management)”.
- 4.2 SuDS mimic the natural drainage system and provide a method of surface water drainage which can decrease the quantity of water discharged, and hence reduce the risk of flooding. In addition to reducing flood risk, these features can improve water quality and provide biodiversity and amenity benefits.
- 4.3 The SuDS management train incorporates a hierarchy of techniques and considers all three SuDS criteria of flood reduction, pollution reduction, and landscape and wildlife benefit. In decreasing order of preference, the preferred means of disposal of surface water runoff is:
  - Discharge to ground.
  - Discharge to a surface water body.
  - Discharge to a surface water sewer.
  - Discharge to a combined sewer.
- 4.4 The philosophy of SuDS is to replicate as closely as possible the natural drainage from a site pre-development and to treat runoff to remove pollutants, resulting in a reduced impact on the receiving watercourses. The benefits of this approach are as follows:
  - Reducing runoff rates, thus reducing the flood risk downstream.
  - Reducing pollutant concentrations, thus protecting the quality of the receiving water body.
  - Groundwater recharge.
  - Contributing to the enhanced amenity and aesthetic value of development areas.
  - Providing habitats for wildlife in developed areas, and opportunity for biodiversity enhancement.

### Site-Specific SuDS

- 4.5 The various SuDS methods need to be considered in relation to site-specific constraints. Several SuDS options are available to reduce or temporarily hold back the discharge of surface water runoff. Table 4.1 outlines the constraints and opportunities to each of the SuDS devices in accordance with the hierarchical approach outlined in The SuDS Manual CIRIA C753. It also indicates what could and could not be incorporated within the development, based upon site-specific criteria.

| Device                                                   | Description                                                                                                                                         | Constraints / Comments                                                                                                                                                                                                                                | Appropriate |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Living roofs (source control)                            | Provide soft landscaping at roof level which reduces surface water runoff.                                                                          | Roof Terraces and Roof Gardens are proposed as part of this development.                                                                                                                                                                              | Yes         |
| Infiltration devices & Soakaways (source control)        | Store runoff and allow water to percolate into the ground via natural infiltration.                                                                 | Potential for high groundwater and contamination indicated due to brownfield site.                                                                                                                                                                    | No          |
| Pervious surfaces (source control)                       | Storm water is allowed to infiltrate through the surface into a storage layer, from which it can either infiltrate and/or slowly release to sewers. | Potential for high groundwater and contamination indicated due to brownfield site. Lined permeable paving is proposed in some pedestrian areas which are outside the main thoroughfares.                                                              | Yes         |
| Rainwater harvesting (source control)                    | Reduces the annual average rate of runoff from the site by reusing water for non-potable uses e.g. toilet flushing, recycling processes.            | Water butts are proposed for Block C and rainwater recycling for land-lord use to wash-down bin stores is also proposed.                                                                                                                              | Yes         |
| Swales (permeable conveyance)                            | Broad shallow channels that convey / store runoff, and allow infiltration (ground conditions permitting).                                           | Bioretention swales and tree-pits are proposed alongside Botolph Street as part of the highway drainage strategy. Further swales and bioretention swales are proposed within pedestrian areas across the site.                                        | Yes         |
| Filter drains & perforated pipes (permeable conveyance)  | Trenches filled with granular materials (to take flows from adjacent impermeable areas) that convey runoff while allowing infiltration.             | Some areas of the site may be suitable for use of filter drains, however no infiltration is expected to be viable due to contamination. Filter drains would therefore be lined and used for Water Quality purposes to filter waters prior to outfall. | Yes         |
| Filter Strips (permeable conveyance)                     | Wide gently sloping areas of grass or dense vegetation that remove pollutants from run-off from adjacent areas.                                     | Potential for high groundwater and contamination indicated due to brownfield site.                                                                                                                                                                    | No          |
| Infiltration basins (end of pipe treatment)              | Depressions in the surface designed to store runoff and allow infiltration.                                                                         | High density city centre site Potential for high groundwater and contamination indicated due to brownfield site.                                                                                                                                      | No          |
| Wet ponds & constructed wetlands (end of pipe treatment) | Provide water quality treatment & temporary storage above the permanent water level.                                                                | High density city centre site so no landscaped areas for ponds and wetlands.                                                                                                                                                                          | No          |
| Attenuation Underground (end of pipe treatment)          | Oversized pipes or geo-cellular tanks designed to store water below ground level.                                                                   | These are proposed as the SuDS listed above will not achieve sufficient volumes to restrict to the required rate. This is likely to be used alongside other means of attenuation at the site to provide the required storage volume.                  | Yes         |

Table 4.1: Site Specific Sustainable Drainage

## Rainwater Harvesting Opportunities Assessment

4.6 Where possible, rainwater harvesting features shall be incorporated in the proposals.

| Device                          | Description                                                              | Constraints / Comments                                                                                                                                                                                                                                                                                        | Appropriate |
|---------------------------------|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| Rainwater Harvesting – Internal | The use of filtered rainwater for reuse in toilets and washing machines. | Given the complex split of usages for the Blocks (residential vs commercial) the infrastructure needed to manage this and the possible risk/concern of maintenance and management of a system to serve private, communal and public use toilet water would be difficult to deliver effectively.               | No          |
| Rainwater Harvesting – External | The use of filtered rainwater for reuse at outside taps.                 | Rainwater harvesting tanks to be incorporated for land- lord bin wash-down, which shall be fed by rainwater downpipes and managed and maintained solely by the land-lord or elected Management and Maintenance Company<br><br>Rainwater Water-Butts are to be incorporated at Block C for Garden Watering Use | Yes         |

Table 4.2: Site Specific Rainwater Harvesting

## Post-Development Run-off Rate

- 4.7 Given the potentially high groundwater and contamination of the site, infiltration is not recommended. It is understood that groundwater monitoring undertaken in May 2022 found groundwater to be around 3.4m bgl, which precludes the use of infiltration devices. There are no nearby watercourses to which a connection could be made, and therefore it is proposed that the development will drain to the existing Anglian Water surface water network in the vicinity of the site at a restricted discharge rate.
- 4.8 As discussed in Section 3, the existing site outfalls unrestricted and untreated into the adopted sewer network. Para. 3.13 summarises the existing outfall rates for each storm event.
- 4.9 For information only, the greenfield run-off rates were calculated using WINDES MicroDrainage software, these are based on a total proposed impermeable area of 4.24ha and are summarised below and included in **Appendix H**.
- QBAR – 0.3 l/s/ha = 1.272 l/s
  - 1:1yr – 0.3 l/s/ha = 1.272 l/s
  - 1:30yr – 0.8 l/s/ha = 3.392 l/s
  - 1:100yr – 1.2 l/s/ha = 5.088 l/s
- 4.10 The greenfield runoff rates are very low due to the local geology of chalk. However, in reality the site is almost 100% impermeable, historical mapping shows the site has been developed since at least 1885 and has been a shopping/town centre for many years. The site is Brownfield and it is therefore considered appropriate to review the existing run-off rates with a view to provide a betterment. Using greenfield run-off rates for a site which has been browfield for over 137 years is inappropriate and would result in excessive attenuation volumes and therefore tank sizes, which could have impacts on other features such as the local archaeology, groundwater and geology.

- 4.11 The site is in a sensitive location, being at the downstream end of a Critical Drainage Area (CDA). The CDA relates largely to offsite surface water flows being directed through the catchment, through the site and ultimately to the River Wensum. There also appears to be local flood issues relating to the capacity of the local sewer network.
- 4.12 As discussed in the separate FRA by Royal Haskoning DHV, measures will be in place to mitigate against the impact of these offsite flows within the site boundary. The proposed drainage system will not be designed to accept offsite flows, but it is considered that a significant improvement can still be made by designing an effective drainage system at the site, which will benefit those downstream of the site by attenuating rainfall within the site boundary. The proposed drainage system will install drainage features which are much smaller and will have less of an impact on other aspects (such as archaeology, sewers and geology).
- 4.13 A pre-development enquiry with Anglian Water has been submitted, to update the enquiry received for the previous scheme. Anglian Water were able to confirm that an outfall rate of 242 l/s to manage all storms up to and including the 1 in 100yr + Climate Change Event would be acceptable – this is based on their calculation of an equivalent 1:1yr discharge rate applied to the existing impermeable area. Surface water should be discharged to the same sewers as the existing site, which are in Edward Street, Pitt Street and St Crispins Road. The proposed discharge rate of 242 l/s would provide a significant betterment to the existing situation.
- 4.14 The Anglian Water Pre-Development Assessment report, confirming an agreeable maximum discharge rate of 242 l/s and the recommended connection points to the existing Anglian Water network is included in **Appendix I**.

### **Proposed Drainage Strategy**

- 4.15 In accordance with the Environment Agency's May 2022 published Climate Change Allowances, all surface water drainage is to be designed to a 1:100yr + 45% Climate Change Event. As per LLFA's Developer Guidance, FEH Rainfall Data shall be used within the hydraulic models. As requested by the LLFA, the hydraulic model assumes that adopted sewers are running at full bore and will be surcharged to the top of pipe.
- 4.16 As described in Section 1, it is proposed to make a Hybrid planning application: Full Planning for Blocks, A, B, C, D, J3, K/L and M and Outline Planning for Blocks E, F, G, H and J.
- 4.17 The Hybrid site layout precludes the option for completely separating drainage for Outline areas from Full-Planning areas however, largely, the drainage systems serve only Outline or only Full-Planning areas.
- 4.18 The development parcels have been split into 9no. drainage catchments:
- System 1 – Serves Block B (Full-Planning)
  - System 2 – Serves Block C (Full-Planning)
  - System 3 – Serves Block D (Full-Planning)
  - System 4 - Serves Block A, M J3 and K/L (Full Planning)
  - System 5 – Serves Botolph Street/Public Realm Area (Full Planning)
  - System 6 – Serves Block E (Outline Planning)

- System 7 – Serves Block F (Outline Planning)
- System 8 – Serves Blocks G and J (Outline Planning)
- System 9 – Serves Block H (Outline Planning)

### System 1 – Block B – Full Planning

- 4.19 SuDS Feature Selection – This catchment comprises residential dwellings, footpaths, patios and parking areas. Residential units facing New Botolph St will have green roofs covering an area of 290m<sup>2</sup>. It is proposed to utilise lined permeable paving to manage run-off from the trafficked areas, whilst a surface water drainage network shall collect run-off from roof, patios and other hardstanding areas. All flows shall be directed to a geo-cellular storage device via a Downstream Defender (proprietary treatment unit). The impermeable area for this catchment has been calculated as: 1651m<sup>2</sup>. The maximum outfall rate for this catchment has been set at **5 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block B on drawing DR-001.
- 4.20 There are two sections of permeable paving attenuation, PP1 covers an area of 476m<sup>2</sup> and PP2 covers an area of 150m<sup>2</sup>. Surface water attenuation volume is provided within the sub-base voids (usually 30% voids and no-fines). Flows from these permeable paving systems are restricted using orifice-plate flow control chambers – flows are then directed to/cascade to the geo-cellular attenuation device which also collects surface water run-off from 806m<sup>2</sup> of roof area (noting that 290m<sup>2</sup> is green roof and assumed to be saturated/impermeable) and 219m<sup>2</sup> of patio and hardstanding areas. Outfall flows from the geo-cellular attenuation device are restricted using a hydrobrake (flow control device) and are directed to the 225dia adopted surface water sewer in Edward Street via a new section of sewer.
- 4.21 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the permeable paving areas and the geo-cellular storage device whilst restricting flows to a maximum of **5 l/s** to manage a 1 in 100 year + 45% Climate Change event. The hydraulic output data shows an attenuation volume of 35.176m<sup>3</sup> in PP1, a volume of 7.765m<sup>3</sup> in PP2 and a volume of 42.909m<sup>3</sup> in the geo-cellular storage device. This can be contained within the sub-base of the permeable paving areas and within a geo-cellular storage device sized 35.2m<sup>2</sup> x 1.32m deep with 95% voids – this provides a maximum attenuation volume of 44.14m<sup>3</sup>. The hydraulic model output for Block B is contained in **Appendix J** as well as the drainage long-sections.
- 4.22 Half Drain Times – The hydraulic model demonstrates that Permeable Paving Area 1 has a half-drain time of 545mins, Permeable Paving Area 2 is 184mins and the Geo-cellular storage device half-drains in 131mins. All well within 24hrs.
- 4.23 Water Quality Assessment – This catchment comprises residential roofs and low-traffic roads only.
- 4.24 CIRIA 763 SuDS Manual Table 26.2 shows Low-Traffic Roads have a Pollution Hazard Level of LOW. All low-traffic roads in this catchment are anticipated to comprise lined permeable paving construction with outfall directed to the adopted sewer via the geo-cellular attenuation device. Table 26.2 shows Low-Traffic Roads have TSS of 0.5 Metals, 0.4 and Hydrocarbons 0.4. Table 26.3, SuDS mitigation indices for discharges to surface waters, shows that Permeable Paving alone provides mitigation for TSS at 0.7; Metals at 0.6 and Hydrocarbons at 0.7. Surface water run-off from low-traffic-road areas is more than sufficiently mitigated by use of Permeable Paving.

- 4.25 CIRIA 763 SuDS Manual Table 26.2 shows Residential Roofs have a Pollution Hazard Level of LOW. Residential Roofs will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit) and the geo-cellular attenuation device. Table 26.2 shows Residential Roofs have TSS of 0.2 Metals 0.2 and Hydrocarbons 0.05. Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from residential roofs and footpaths, it is considered more than sufficient to provide water treatment.

## System 2 – Block C – Full Planning

- 4.26 SuDS Feature Selection – This catchment comprises residential dwellings and hard and soft landscaping areas. A surface water drainage network shall collect run-off from all impermeable areas and with all flows are directed to a geo-cellular storage device with restricted flows passing through a Bioretention Swale. The contributing area for this catchment has been calculated as: 750m<sup>2</sup>, comprising 435m<sup>2</sup> of Green Roof, 50m<sup>2</sup> of Roof area and 265 m<sup>2</sup> of pedestrian hardstanding. It is assumed that green-roofs will be saturated and therefore impermeable for the purpose of these hydraulic calculations. The maximum outfall rate for this catchment has been set at 5 l/s to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in Appendix K and shows the network serving Block C on drawing DR-001.
- 4.27 Surface water run-off from the Green Roof areas is collected in a surface water drainage network which outfalls to a geo-cellular attenuation device via a Swale. Run-off from pedestrian/hard landscaping is directed to a Bio-retention Swale and directed to the surface water drainage network via a perforated pipe. Flows from the geo-cellular attenuation device are restricted using a pump which pumps flows into the filter medium within the Bio-retention Swale. A perforated pipe at the base of the bioretention swale then outfalls to a demarcation chamber prior to discharge to the 225dia adopted surface water sewer in Edward Street via a new connection.
- 4.28 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to a maximum of 5 l/s to manage a 1 in 100 year + 45% Climate Change event. The hydraulic output data shows an attenuation volume of 28.327m<sup>3</sup> in the geo-cellular storage device. This can be contained within a geo-cellular storage device sized 23.0m<sup>2</sup> x 1.32m deep with 95% voids – this provides a maximum attenuation volume of 28.842m<sup>3</sup>. The hydraulic model output for Block C is contained in **Appendix J** as well as the drainage long-sections.
- 4.29 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 78mins. Well within 24hrs.
- 4.30 Water Quality Assessment – This catchment comprises footpaths and residential roofs only.
- 4.31 CIRIA 763 SuDS Manual Table 26.2 shows Residential Roofs have a Pollution Hazard Level of LOW. Residential Roofs will discharge directly to the adopted sewer via a Filter Drain and the geo-cellular attenuation device. Table 26.2 shows Residential Roofs have TSS of 0.2 Metals 0.2 and Hydrocarbons 0.05. Table 26.3, SuDS mitigation indices for discharges to surface waters, shows that a Bioretention system provides mitigation for TSS at 0.8; Metals at 0.8 and Hydrocarbons at 0.8. Surface water run-off from residential roof areas is more than sufficiently mitigated by use of a Bio-Retention Swale

### System 3 – Block D – Full Planning

- 4.32 SuDS Feature Selection – This catchment comprises a commercial unit block with residential dwellings above, with 570m<sup>2</sup> of green roof. The catchment also includes public realm area with bio-retention tree-pits and bioretention swales within pedestrian walkways. To be conservative, the hydraulic models shall assume green-roofs are saturated and will not allow for any impermeable areas, as such will be considered 100% impermeable with a contributing area of 2580m<sup>2</sup>. The maximum outfall rate for this catchment has been set at **12.5 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block D on drawing DR-001.
- 4.33 Surface water run-off from roof areas is collected in a surface water drainage network. This surface water drainage network also collects from the bioretention tree pits and swales which collect run-off from the pedestrian walkways. All flows are directed to a geo-cellular storage device with restricted flows passing through a Bioretention Swale prior to outfall to the 675dia diverted Anglian Water Sewer crossing the site.
- 4.34 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to a maximum of **12.5 l/s** to manage a 1 in 100 year + 45% Climate Change event. The hydraulic output data shows an attenuation volume of 94.235m<sup>3</sup> in the geo-cellular storage device. This can be contained within a geo-cellular storage device sized 71.0m<sup>2</sup> x 1.32m deep with 95% voids – this provides a maximum attenuation volume of 89.034m<sup>3</sup> (NB: some storage volume is contained within the drainage network itself). The hydraulic model output for Block D is contained in **Appendix J** as well as the drainage long-sections.
- 4.35 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 112mins. All well within 24hrs.
- 4.36 Water Quality Assessment – This catchment comprises commercial/residential roofs and pedestrian walkways only.
- 4.37 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Bioretention Swale. Table 26.2 shows Other Roofs have TSS of 0.3 Metals 0.2 and Hydrocarbons 0.05. Table 26.3, SuDS mitigation indices for discharges to surface waters, shows that bioretention systems provide mitigation for TSS at 0.8; Metals at 0.8 and Hydrocarbons at 0.8. Surface water run-off from this catchment is more than sufficiently mitigated by use of a Bioretention Swale.

### System 4 – Blocks A, M, J3 and K/L – Full Planning

- 4.38 SuDS Feature Selection – This catchment comprises commercial blocks with residential dwellings above, with 1750m<sup>2</sup> of green roof. The catchment also includes public realm area with bio-retention tree-pits and bioretention swales within pedestrian walkways. To be conservative, the hydraulic models shall assume green-roofs are saturated and will not allow for any impermeable areas, as such will be considered 100% impermeable with a contributing area of 14,850m<sup>2</sup>. The maximum outfall rate for this catchment has been set at **65.0 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. All flows shall be directed to a Geo-cellular attenuation device. Some run-off from pedestrian walkway areas will benefit from bioretention tree-pit and bioretention swales however as described

above, to be conservative, it is assumed that 'green' SuDS features will be saturated and will not contribute to attenuation volumes. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving this catchment on drawings DR-001, DR-002, DR-003 and DR-004.

- 4.39 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to **65.0 l/s**. Any attenuation volume that may be provided in green roofs and bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation volume of 500.184m<sup>3</sup> in the geo-cellular storage device with a maximum outfall rate of **65.0 l/s** is required to manage a 1 in 100 year + 40% Climate Change event. This can be contained within a geo-cellular storage device sized 307.2m<sup>2</sup> x 1.67m with 95% voids – this provides a maximum attenuation volume of 487.37m<sup>3</sup> (NB: some storage volume is contained within the drainage network itself). The hydraulic model output for Block D is contained in **Appendix J** as well as the drainage long-sections.
- 4.40 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 133mins. All well within 24hrs.
- 4.41 Water Quality Assessment – This catchment comprises commercial/residential roofs and pedestrian walkways only.
- 4.42 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from roof areas and pedestrian walkways (noting that some run-off would have already been cleansed by green roofs and bioretention systems), it is considered more than sufficient to provide water treatment.

### System 5 – Botolph Street/Public Realm Area – Full Planning

- 4.43 SuDS Feature Selection – This catchment comprises a large public realm with pedestrian walkways and bioretention swales. Some areas to the south of Botolph Street shall be trafficked. Surface water runoff shall be directed into Bioretention Swales and where this is not possible into channel drains. To be conservative, the hydraulic models shall assume 100% impermeable area (with no allowance for the bioretention swales) as such the contributing area is 1630m<sup>2</sup>. The maximum outfall rate for this catchment has been set at **10.0 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. All flows shall be directed to an oversized pipe system with outfall restricted via a hydrobrake flow control device. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving this catchment on drawings DR-002.
- 4.44 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the over-size pipe system whilst restricting flows to **10.0 l/s**. Any attenuation volume that may be provided in bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation

volume of 58.648m<sup>3</sup> (which is the sum of the maximum volume within each pipe-run) is required to manage a 1 in 100 year + 40% Climate Change event with flow restricted to **10 l/s**. The hydraulic model output for Botolph Street is contained in **Appendix J** as well as the drainage long-sections.

- 4.45 Water Quality Assessment – This catchment comprises pedestrian walkways only.
- 4.46 CIRIA 763 SuDS Manual Table 26.2 shows Low-Trafficked Roads have a Pollution Hazard Level of LOW. Run-off will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters mainly from pedestrian areas with some small areas of trafficked hardstanding, (noting that some run-off would have already been cleansed by bioretention systems), it is considered more than sufficient to provide water treatment.

### System 6 – Block E – Outline Planning

- 4.47 SuDS Feature Selection – This catchment comprises commercial units with residential dwellings above and some public realm/pedestrian walkways. Green roof shall cover some roof area. Some bioretention swales shall collect run-off from highway areas to the west, which has been agreed in principle with the Highway Authority. Details of the split between private and highway catchments and the drainage features which serve these areas shall be confirmed during detailed design stage. For now, and to be conservative, the hydraulic models shall assume all areas within the catchment boundary shall be collected within a private drainage network. The catchment shall be considered 100% impermeable with a contributing area of 6420m<sup>2</sup>.
- 4.48 At this Outline stage the surface water drainage strategy shall allow for all waters to be collected within a Geocellular attenuation device with a restricted outfall directed to the diverted adopted 675dia surface water sewer crossing the site. Flows shall be cleansed via a Downstream Defender (proprietary treatment unit) prior to outfall. The maximum outfall rate for this catchment has been set at **30.0 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block E on drawing DR-003.
- 4.49 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to **30.0 l/s**. Any attenuation volume that may be provided in green roofs and bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation volume of 310.8m<sup>3</sup> in the geo-cellular storage device with a maximum outfall rate of **30.0 l/s** is required to manage a 1 in 100 year + 40% Climate Change event. This can be contained within a geo-cellular storage device sized 166.4m<sup>2</sup> x 1.98m with 95% voids – this provides a maximum attenuation volume of 312.99m<sup>3</sup>. The hydraulic model output for Block E is contained in **Appendix J**.
- 4.50 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 102mins. All well within 24hrs.
- 4.51 Water Quality – This catchment comprises Other Roofs as well as Pedestrian Walkways.

- 4.52 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from roof areas and pedestrian walkways (noting that some run-off would have already been cleansed by green roofs and bioretention systems), it is considered more than sufficient to provide water treatment.

### System 7 – Block F – Outline Planning

- 4.53 SuDS Feature Selection – This catchment comprises commercial units with residential dwellings above and some public realm/pedestrian walkways. Green roof shall cover some roof area whilst a section of permeable paving system shall form the external parking area (approx.265 m<sup>2</sup>). Bioretention swales shall collect run-off from pedestrian walkways where possible. For now, and to be conservative, the hydraulic models shall assume all areas within the catchment boundary shall be collected within a private drainage network. The catchment shall be considered 100% impermeable with a contributing area of 4460m<sup>2</sup>.
- 4.54 At this Outline stage the surface water drainage strategy shall allow for all waters to be collected within a Geocellular attenuation device with a restricted outfall directed to the diverted adopted 675dia surface water sewer crossing the site. Flows shall be cleansed via a Downstream Defender (proprietary treatment unit) prior to outfall. The maximum outfall rate for this catchment has been set at **20.0 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block F on drawing DR-003.
- 4.55 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to **20.0 l/s**. Any attenuation volume that may be provided in green roofs and bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation volume of 209.1m<sup>3</sup> in the geo-cellular storage device with a maximum outfall rate of **20.0 l/s** is required to manage a 1 in 100 year + 40% Climate Change event. This can be contained within a geo-cellular storage device sized 112.6m<sup>2</sup> x 1.98m with 95% voids – this provides a maximum attenuation volume of 211.8m<sup>3</sup>. The hydraulic model output for Block F is contained in **Appendix J**.
- 4.56 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 90mins. All well within 24hrs.
- 4.57 Water Quality Assessment – This catchment comprises commercial/residential roofs, pedestrian walkways and low-traffic roads only.
- 4.58 CIRIA 763 SuDS Manual Table 26.2 shows Low-Traffic Roads have a Pollution Hazard Level of LOW. All low-traffic roads in this catchment are anticipated to comprise lined permeable paving construction with outfall directed to the adopted sewer via the geo-cellular attenuation device. Table 26.2 shows Low-Traffic Roads have TSS of 0.5 Metals, 0.4 and Hydrocarbons 0.4. Table 26.3, SuDS mitigation indices for discharges to surface waters, shows that Permeable Paving alone provides mitigation for TSS at 0.7; Metals at 0.6 and Hydrocarbons at 0.7. Surface water run-off from low-traffic-road areas is more than sufficiently mitigated by use of Permeable Paving.

- 4.59 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from roof areas and pedestrian walkways (noting that some run-off would have already been cleansed by green roofs and bioretention systems), it is considered more than sufficient to provide water treatment.

### System 8 – Blocks G and J – Outline Planning

- 4.60 “SuDS Feature Selection – This catchment comprises residential units, commercial units with residential dwellings above as well as some public realm/pedestrian walkways and access vehicular access. Green roof shall cover some roof area. Permeable paving covering an area of approx. 614 m<sup>2</sup> shall collect surface water run-off from areas that will be trafficked. Bioretention swales shall collect run-off from pedestrian walkways where possible. For now, and to be conservative, the hydraulic models shall assume all areas within the catchment boundary shall be collected within a private drainage network. The catchment shall be considered 100% impermeable with a contributing area of 9640m<sup>2</sup>.
- 4.61 At this Outline stage the surface water drainage strategy shall allow for all waters to be collected within a Geocellular attenuation device with a restricted outfall directed to the diverted adopted 675dia surface water sewer crossing the site. Flows shall be cleansed via a Downstream Defender (proprietary treatment unit) prior to outfall. The maximum outfall rate for this catchment has been set at **70.0 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block F on drawing DR-003 and DR-004.
- 4.62 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to **70.0 l/s**. Any attenuation volume that may be provided in green roofs and bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation volume of 370.4m<sup>3</sup> in the geo-cellular storage device with a maximum outfall rate of **70.0 l/s** is required to manage a 1 in 100 year + 40% Climate Change event. This can be contained within a geo-cellular storage device sized 195.8m<sup>2</sup> x 1.67m with 95% voids – this provides a maximum attenuation volume of 310.63m<sup>3</sup>. The hydraulic model output for Block G and J is contained in **Appendix J**.
- 4.63 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 53mins. All well within 24hrs.
- 4.64 Water Quality Assessment – This catchment comprises commercial/residential roofs, pedestrian walkways and low-traffic roads only.
- 4.65 CIRIA 763 SuDS Manual Table 26.2 shows Low-Traffic Roads have a Pollution Hazard Level of LOW. All low-traffic roads in this catchment are anticipated to comprise lined permeable paving construction with outfall directed to the adopted sewer via the geo-cellular attenuation device. Table 26.2 shows Low-Traffic Roads have TSS of 0.5 Metals, 0.4 and Hydrocarbons 0.4. Table 26.3, SuDS mitigation indices for discharges to surface waters, shows that Permeable Paving alone provides mitigation for TSS at 0.7; Metals at 0.6 and Hydrocarbons at 0.7. Surface water run-off from low-traffic-road areas is more than sufficiently mitigated by

use of Permeable Paving.

- 4.66 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from roof areas and pedestrian walkways (noting that some run-off would have already been cleansed by green roofs and bioretention systems), it is considered more than sufficient to provide water treatment.

## System 9 – Block H – Outline Planning

- 4.67 SuDS Feature Selection – This catchment comprises commercial units with residential dwellings above and some public realm/pedestrian walkways. Green roof shall cover some roof area. Bioretention swales shall collect run-off from pedestrian walkways where possible. For now, and to be conservative, the hydraulic models shall assume all areas within the catchment boundary shall be collected within a private drainage network. The catchment shall be considered 100% impermeable with a contributing area of 3460m<sup>2</sup>.
- 4.68 At this Outline stage the surface water drainage strategy shall allow for all waters to be collected within a Geocellular attenuation device with a restricted outfall directed to the diverted adopted 675dia surface water sewer crossing the site. Flows shall be cleansed via a Downstream Defender (proprietary treatment unit) prior to outfall. The maximum outfall rate for this catchment has been set at **24.5 l/s** to manage all storms up to and including the 1 in 100yr + 45% Climate Change Event. The proposed Surface Water Drainage Layouts are contained in **Appendix K** and shows the network serving Block H on drawing DR-002.
- 4.69 WINDES MicroDrainage modelling software has been used to calculate the required attenuation volume for the geo-cellular storage device whilst restricting flows to **24.5 l/s**. Any attenuation volume that may be provided in green roofs and bio-retention areas has not been allowed for to ensure a robust estimation of the required attenuation volumes to serve this catchment are made. The hydraulic output data is contained in **Appendix J** and shows an attenuation volume of 141.1m<sup>3</sup> in the geo-cellular storage device with a maximum outfall rate of **24.5 l/s** is required to manage a 1 in 100 year + 40% Climate Change event. This can be contained within a geo-cellular storage device sized 112.0m<sup>2</sup> x 1.32m with 95% voids – this provides a maximum attenuation volume of 140.448m<sup>3</sup>. The hydraulic model output for Block H is contained in **Appendix J**.
- 4.70 Half Drain Times – The hydraulic model demonstrates the Geo-cellular storage device half-drains in 61mins. All well within 24hrs.
- 4.71 Water Quality – This catchment comprises Other Roofs as well as Pedestrian Walkways.
- 4.72 CIRIA 763 SuDS Manual Table 26.2 shows Other Roofs (commercial/industrial) have a Pollution Hazard Level of LOW. Roofs and pedestrian walkways will discharge directly to the adopted sewer via a Downstream Defender (proprietary treatment unit). Table 26.3, SuDS mitigation indices for discharges to surface waters, states that proprietary treatment systems must demonstrate that they can address each contaminate type to an acceptable level. As this Downstream Defender is required solely to cleanse waters from roof areas and pedestrian walkways (noting that some run-off would have already been cleansed by green roofs and bioretention systems), it is considered more than sufficient to provide water treatment.

## Summary of Catchments and Proposed Outfall Rates

- 4.73 As discussed in para. 4.13, the total allowable outfall rate for the Anglia Square Regeneration site has been set at 242 l/s, which is a 57% reduction against the existing situation – a significant betterment. Below is a breakdown of outfall rates for each catchment (System) and total:
- System 1 – Maximum surface water outfall rate of 5.0 l/s

- System 2 – Maximum surface water outfall rate of 5.0 l/s
- System 3 – Maximum surface water outfall rate of 12.5 l/s
- System 4 - Maximum surface water outfall rate of 65.0 l/s
- System 5 – Maximum surface water outfall rate of 10.0 l/s
- System 6 – Maximum surface water outfall rate of 30.0 l/s
- System 7 – S Maximum surface water outfall rate of 20.0 l/s
- System 8 – Maximum surface water outfall rate of 70.0 l/s
- System 9 - Maximum surface water outfall rate of 24.5 l/s
- All Systems – Total 242.0 l/s maximum outfall rate to manage all storms up to and including the 1:100yr + 45% Climate Change Event. The equivalent of 43% of the existing 1:1yr surface water run-off rate. This is a significant improvement to the existing situation. In addition, the existing drainage system does not benefit from any water treatment stages, whilst the proposed drainage strategy allows for water quality and treatment stages to meet the guidance within CIRIA 753 SuDS Manual.

### **Attenuation Tank Alarm System**

- 4.1 It is proposed that the attenuation tanks serving the external hardstanding areas/pedestrian walkways will have alarms fitted internally. As it is not possible to separate the offsite flows from the onsite runoff in these areas, it is recommended that alarm detection sensor is fitted at around the 75% capacity level of the tanks serving the hardstanding areas (Systems 03 to 08). The 75% capacity level was considered to be acceptable as it would ensure the alarms would not be triggered in the lower return period, every day events, but further analysis should be carried out to verify this. The specific level that the alarm sensors would be fitted within the tanks will be established during the preparation of the Flood Warning Plan, which it has been agreed with Norwich City Council Emergency Planning Team can be conditioned and prepared post-planning. The flood warning strategy has been discussed further in Section 8 of the Royal Haskoning DHV Flood Risk Assessment Report.

### Surface Water Pumps Alarm System

- 4.74 Wherever possible it is proposed to utilise an outfall to the adopted sewer network via a gravity connection using a hydrobrake or other suitable flow control device, such as orifice plates for permeable paving outlets. Where this is not possible, due to the receiving sewer being higher than the proposed drainage, surface water has to be pumped to a 'demarcation' chamber to allow waters to flow into the adopted sewer network by gravity connection.
- 4.75 Where surface water pumps are to be used, it is proposed to install a secondary back-up pump with a telemetry alarm system. The telemetry alarm system shall be linked to the elected Maintenance and Management Company to alert in case of primary pump failure. In the event of primary pump failure, the secondary pump shall manage flows until the primary pump is repaired or replaced. In the unlikely event that the secondary pump fails before the primary pump is repaired, the telemetry alarm system will alert the Management and Maintenance Company who shall install a temporary pump.
- 4.76 The risk of pump failure is low, however in the very unlikely event that primary, secondary and temporary pumps all fail, waters would fill the attenuation tanks and overspill into the public realm, following the overland flow paths. There is no risk to property as pumps and tanks are located externally.

### Exceedance Routes

- 4.77 In the event of a greater than 1 in 100 year (+45%CC) rainfall event occurring, the exceedance routes would follow proposed and existing surface water flow paths as identified in Figure 1 below:

Figure 1 – Exceedance Routes

- 4.78 As discussed in the separate FRA, the hydraulic model assumes the public sewer system is almost at capacity and there is no drainage system within the site boundary. This would result in the overland flows collecting in the pedestrian walkways and passing through the site from north west to south east. The flows would leave the site at Magdalen Street on the western and south western boundary. It is noted that if the drainage system was at capacity,

the site layout and sloping pedestrian walkways have been set out to ensure flowpaths are not blocked.

### Sewer Diversions

- 4.79 As noted in Section 3, there are a number of Anglian Water sewers passing through the existing site. Anglian Water were consulted in 2018 for the previous scheme on the potential diversion of several of their sewers around the proposed development and it is understood that this will need to be considered in detail at a later stage through a diversion application, when information such as the foundation design is available. Anglian Water Drainage Engineer Darren Sewell provided some information on the requirements when diverting sewers within a new development site. This has been included at **Appendix L**. To summarise:
- 4.80 Any re-development areas falling within 3m of an existing public sewer but remaining only 'built near' an existing sewer, assuming the same clearance and access is available, would in principle be acceptable.
- 4.81 Any areas falling within 3m of the existing public sewer would need to comply with Part H4 Building Regulations in respect of 'building near' public sewers and Anglian Water criteria on the website.
- 4.82 Foundation design of the new buildings would need to be carefully considered to ensure that no loading would be transferred on a 45 degree 'angle of repose' onto the sewer.
- 4.83 The only area which would appear to require consideration of a formal diversion of a sewer would be the existing 675mm diameter surface water sewer and the existing 225mm foul sewer running immediately south of unit A1.01 (675mm surface water sewer close to MH 0453 to 0456 and 225mm foul sewer near to MH 0405 to 0408).
- 4.84 The above sewer may require a diversion, and the technicalities of this will be considered at a later stage. Anglian Water could consider formally divesting some sections of the existing public sewer which are no longer needed/fall beneath buildings (these need to be sewers serving only the existing site and no third parties). This means the Developer would apply to divest the sewer into their private ownership, and these sections of divested sewer could then be removed if no longer needed.
- 4.85 It would be necessary to consult Anglian Water further on the diverting and divesting of their public sewers across the site prior to any development taking place, to ensure that the issues raised in the email at **Appendix L** have been addressed.
- 4.86 It is expected that the advice provided by Anglian Water for the previous scheme is still relevant. It should be noted that Anglian Water have been contacted again to confirm this. Once their response has been received, this section of the report will be amended accordingly.

### Foul Sewer Network

- 4.87 An Anglian Water capacity check was carried out for the previous scheme to determine whether there would be sufficient capacity within their existing foul network to accommodate the foul flows from the proposed development. This is in their pre-development enquiry in

**Appendix I** and confirms that there was sufficient capacity in the existing foul network and no improvements would be needed to the network.

## 5 Proposed SuDS Features Information

### SuDS Features and the “Four Pillars of SuDS”

- 5.1 The city center site gives opportunities for “urban types” of SuDS features to be incorporated. These features provide water quality and biodiversity betterments and it is proposed that wherever possible, these features will form the wider SuDS Drainage Strategy. The Full- Planning Application layout allows for numerous bioretention swales and tree-pits within the strategy as well as extensive and intensive green-roof areas. The Outline Planning Application layouts also allow for bioretention systems and green roofs which will be detailed at a later design stage.
- 5.2 The surface water drainage attenuation requirements for the site do not include any attenuation volumes that may be provided by the following features as such, at detailed design stage/post-planning, it is possible that overall storage volumes could be reduced.
- 5.3 For now, the robust surface water drainage strategy as described in Section 4 demonstrates that the proposals can provide a significant betterment to the existing situation in terms of reduced outfall rates and provision of attenuation features which manage all storm events up to and including the 1:100yr + Climate Change event.

### Green Roofs

- 5.4 Green Roofs will provide Amenity, Biodiversity, Water Quality and Water Volume benefits in line with the Four Pillars of SuDS. Amenity space is formed by roof-top gardens and terraces for. Biodiversity is formed by use of extensive and intensive green-roofs. Water Quality, the green roof areas will provide a treatment stage for surface water runoff. Water Volume, green roofs provide attenuation volume and slow the rate of waters entering the main sewer system. Transpiration shall also reduce overall water volumes.
- 5.5 CIRIA SuDS Manual C753 Chapter 12 describes Green Roofs as follows:
- 5.6 *“Green roofs area areas of living vegetation, installed on the top of buildings, for a range of reasons including visual benefit, ecological value, enhanced building performance and the reduction of surface water runoff. Types of green roof can be divided into two main categories:*  
*-Extensive roofs, have low substrate depths (and therefore low loadings on the building structure), simple planting and low maintenance requirements; they tend not to be accessible.*  
*-Intensive roofs (or roof gardens) have deeper substrated (and therefore highwe loadings on the building structure) that can support a wide variety of planting but which tend to require more intensive maintenance; they are usually accessible.”*

- 5.7 The Full Planning proposals include for a number of garden roof terraces which comprise some areas of extensive and intensive type green roof as well as paved areas – these are currently detailed on Blocks A, D, M and K/L. Green roofs are also shown indicatively on Outline Application Blocks E, F, G, J, and H, it is expected that these will also comprise extensive and intensive green roof areas and paved areas. As described above, the drainage calculations in Section 4 do not account for any attenuation that may be available on green roof areas. However, as a general rule, it is assumed that green roofs are saturated when calculating a site's attenuation requirements anyhow.
- 5.8 Green roofs and Garden Roof Terraces will provide water quality and biodiversity benefits to the overall scheme.

#### **Bio-Retention Swales**

- 5.9 Bio-Retention Swales will provide Amenity, Biodiversity, Water Quality and Water Volume benefits in line with the Four Pillars of SuDS. Amenity space is formed by shallow swales with stepping stones and seating areas. Biodiversity is formed by use of suitable planting. In terms of Water Quality, the bioretention swales shall provide a treatment stage for surface water runoff. Water Volume – bioretention swales shall provide attenuation volume and slow the rate of waters entering the main sewer system. Transpiration shall also reduce overall water volumes.
- 5.10 CIRIA SuDS Manual C753 Chapter 18 describes Bio-Retention Systems as follows:

*“Bioretention systems (including rain gardens) are shallow landscaped depressions that can reduce run-off rates and volumes, and treat pollution through the use of engineered soils and vegetation. They are particularly effective in delivering interception and can also provide: attractive landscape features that are self-irrigating and fertilising; habitat and biodiversity; and cooling of the micro-climate due to evapotranspiration.”*

- 5.11 Bio-Retention Swales are proposed within the public realm of the Full Planning Application and Outline Planning Application areas. Where possible, surface water run-off from public realm hardstanding shall be directed to these bioretention systems which shall provide a first stage of attenuation and treatment of run-off. Overflow from these bio-retention swales shall be directed into the wider surface water drainage system.
- 5.12 Norwich County Council's Highway Team have been consulted as part of the application consultation process and have commented upon the provision of bio-retention swales along the western boundary of the site which would collect surface water run-off from Botolph Street and form part of the highway drainage network. They have raised no objection shall require a commuted sum in order to adopt them. This will be detailed further post-planning in any S278/S38 negotiations.

### Tree Planters

- 5.13 Bio-Retention Swales will provide Biodiversity, Water Quality and Water Volume benefits in line with the Four Pillars of SuDS. Biodiversity is formed by use of suitable planting. In terms of Water Quality, the bioretention tree-pit filter mediums shall provide a treatment stage for surface water runoff. Water Volume – bioretention tree-pits shall provide attenuation volume and slow the rate of waters entering the main sewer system. Transpiration shall also reduce overall water volumes.
- 5.14 CIRIA SuDS Manual C753 Chapter 19 describes Tree Systems as follows:

*“Trees and their planting structures provide benefits to surface water management in the following ways:*

*Transpiration – This is the process by which water, taken in from soil by tree roots, is evaporated through the pores or stomata on the surface of leaves. Trees draw large quantities of water from the soil, which can contribute to reducing run-off volumes.*

*Interception – Leaves, branches and trunk surfaces intercept (store and allow water to evaporate) and absorb rainfall, reducing the amount of water that reached the ground, delaying the onset and reducing the volume of run-off.*

*Increased infiltration – Root growth and decomposition increase soil infiltration capacity and rate, reducing runoff volumes.*

*Phytoremediation – In the process of drawing water from the soil, trees also take up trace amounts of harmful chemicals, including metals, organic compounds, fuels and solvents that*

are present in the soil. Inside the tree, these chemicals can be transformed into less harmful substances, used as nutrients and/or stored in roots, stems and leaves.

...Tree Planters are essentially bio-retention systems with trees in them, to enhance capacity and performance, and/or to deliver amenity and biodiversity benefits. They have similar functionality and design requirements to standard tree pits, but have open surface and generally a larger surface area, so their overall appearance is different"

- 5.15 Bio-Retention Tree-Pits are proposed within the public realm of the Full Planning Application and Outline Planning Application areas. Where possible, surface water run-off from public realm hardstanding shall be directed to these bioretention systems which shall provide a first stage of attenuation and treatment of run-off. Overflow from these bio-retention swales shall be directed into the wider surface water drainage system.

### Pervious Pavements

- 5.16 Pervious Pavements will provide Water Quality and Water Volume benefits in line with the Four Pillars of SuDS. In terms of Water Quality, the subbase gravels shall provide a treatment stage for surface water runoff. Water Volume – subbase gravels shall provide attenuation volume and slow the rate of waters entering the main sewer system. Some transpiration shall also reduce overall water volumes as waters within the subbase and within sand layers between blocks shall have (little) opportunity to evaporate – this is still to be considered overall.
- 5.17 CIRIA SuDS Manual C753 Chapter 20 describes Pervious Pavements as follows:

*"Pervious surfaces, along with their associated substructures, are an efficient means of managing surface water runoff close to its source – intercepting runoff, reducing the volume and frequency of runoff, and providing a treatment medium. Treatment processes that occur within the surface structure, the subsurface matrix and the geotextile layers include:*

-Filtration  
-Absorption  
-Biodegradation  
-Sedimentation”

- 5.18 Sections of Lined Permeable Block Paving Attenuation System are proposed across the site. The access road and parking areas for Block A in the north of the site; the forecourts in Block H, Block E/F and F; and the hardstanding areas to the south of and in between Blocks G and J will all comprise permeable paving attenuation.

## 6 Maintenance of Development Drainage

- 6.1 The responsibility for ongoing maintenance will be the responsibility of an elected Management and Maintenance Company whom will be appointed by the Site Owner.
- 6.2 The proposed private surface water sewers, attenuation tanks and green/brown roofs should be regularly inspected and maintained to ensure they are effective throughout the lifetime of the development and do not become blocked or damaged over time.
- 6.3 It is proposed to install secondary (back-up) pumps within the pumping chamber for each of the pumps serving the proposed development. The secondary pumps will be programmed to start should the primary pump fail. Both pumps will have an alarm system in place which will be directed to a control panel within the management's office. In addition, an 'Alarm-Tel' feature will be put in place to monitor the state of operation of the various pumps. When a fault occurs it will automatically dial up to three telephone numbers with a pre-recorded message alerting the problem. In the unlikely event that both pumps fail and maintenance hasn't yet had a chance to resolve the problem, it should be noted that no residential dwelling is present at ground floor or basement level within the main Anglia Square development, so if minor flooding should occur the risk to people is low. Please note – the 'Alarm-Tel' feature should be separate to the flood warning sensor on the attenuation tanks, as the attenuation tank reaching capacity could not be detected by the pump.
- 6.4 Some maintenance details for elements of the drainage system from CIRIA SUDS Manual (C753) are included in Tables 6.1 and 6.2 below.

| Maintenance Schedule | Required Action                                                                                                                                                                                | Frequency                               |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Regular maintenance  | Inspect and identify any areas that are not operating correctly. If required, take remedial action.                                                                                            | Monthly for 3 months, then annually     |
|                      | Remove debris from the catchment surface (where it may cause risks to performance) and from silt traps prior to cells.                                                                         | Monthly                                 |
|                      | For systems where rainfall infiltrates into the tank from above, check surface of filter for blockage by sediment, algae or other matter; remove and replace surface infiltration as necessary | Annually                                |
|                      | Remove sediment from pre-treatment structures and/or internal forebays                                                                                                                         | Annually or as required                 |
| Remedial actions     | Reconstruct soakaway if performance deteriorates or in the event of failure.                                                                                                                   | As required                             |
| Monitoring           | Inspect silt traps and note rate of sediment accumulation                                                                                                                                      | Monthly in the first year then annually |
|                      | Survey inside of tank for sediment build up and remove if necessary.                                                                                                                           | Every 5 years or as required            |

Table 6.1: Maintenance tasks for attenuation tanks (Source: CIRIA C753, The SuDS Manual)

| Maintenance Schedule   | Required Action                                                                                                                                      | Frequency                                                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regular maintenance    | Brushing and vacuuming.                                                                                                                              | Three times per year at end of winter, mid-summer, after autumn leaf fall, or as required based on site specific observations of clogging or manufacturer's recommendations. |
| Occasional maintenance | Stabilise and mow contributing and adjacent areas.                                                                                                   | As required.                                                                                                                                                                 |
|                        | Removal of weeds.                                                                                                                                    | As required.                                                                                                                                                                 |
| Remedial actions       | Remediate any landscaping which, through vegetation maintenance of soil slip, has been raised to within 50mm of the level of the paving.             | As required                                                                                                                                                                  |
|                        | Remedial work to any depressions, rutting and cracked or broken blocks considered detrimental to the structural performance of a hazard to the user. | As required                                                                                                                                                                  |
|                        | Rehabilitation of surface and upper sub-surface.                                                                                                     | As required (if infiltration performance is reduced as a result of significant clogging.)                                                                                    |
| Monitoring             | Initial inspection                                                                                                                                   | Monthly for 3 months after installation. 3 monthly, 48 hours after large storms.                                                                                             |
|                        | Inspect for evidence of poor operation and/or weed growth. If required, take remedial action                                                         | Annually.                                                                                                                                                                    |
|                        | Inspect silt accumulation rates and establish appropriate brushing frequencies.                                                                      | Annually.                                                                                                                                                                    |
|                        | Monitor inspection chambers.                                                                                                                         | Annually                                                                                                                                                                     |

Table 6.2: Maintenance tasks for permeable paving (Source: CIRIA C753, The SuDS Manual)

### Manholes and Sewers

- 6.5 Manhole covers should be lifted each year to remove visible debris and check for blockages – it is suggested that this is undertaken every November after the heaviest leaf-fall has occurred.
- 6.6 Should a blockage occur at any time, it is advised to seek professional help to jet the drainage system to clean and clear the system.

**Gutters and Downpipes**

- 6.7 It is good practice to ensure that these are occasionally inspected to ensure they are in good order and free of leaves & debris. Once every 6 months should be sufficient.

**Orifice Plate with Suitable Filter**

- 6.8 It is advised that maintenance company take time to review the manufactures maintenance recommendations and follow accordingly, with regular inspections anticipated to be required every 3 months and after heavy rainfall events.

## 7 Water Quality Management During Construction

- 7.1 It is anticipated that a suitably worded Condition to Planning shall be included which sets out requirement to confirm any schemes for water quality management during the construction of the development. For guidance and to demonstrate that this has been considered during the planning stage, the following information has been provided:
- 7.2 Activities such as earthworks and construction plant use may result in an increase of silt load in surface water runoff onsite. The presence of heavy plant and other vehicles onsite also introduces the potential for spillages, for example, diesel and hydraulic fluids, wet concrete, construction chemicals and wash-down wastes. Contaminants could enter the sub-soils, surface water, groundwater and nearby watercourse via infiltration and surface water runoff.
- 7.3 Earthmoving operations should be sequenced and timed to avoid heavy rainfall events. This will reduce the risk of soils and silts being mobilised within surface water run-off. Designated vehicle washdown areas shall be provided. Wash-down and surface water run-off from this area will be directed to the drainage network via a silt trap and oil interceptor and a suitable agreement for a temporary use with Anglian Water will be sought. A watching brief for unforeseen contamination of groundwater and surface water will be prepared. Spillages of fuels and chemicals will be controlled in secure bunded areas and containment at refuelling and maintenance facilities in accordance with the EA guidelines.

## 8 Conclusions

- 8.1 EAS have been commissioned by Weston Homes Ltd to prepare a Surface Water Drainage Strategy for the redevelopment of Anglia Square, Norwich, Norfolk.
- 8.2 A separate report, undertaken by others, deals with the flood risk assessment, hydraulic modelling study and impact assessment and should be read in conjunction with this report.
- 8.3 As described in Section 1, it is proposed to make a Hybrid planning application: Full Planning for Blocks, A, B, C, J3, K/L and M and Outline Planning for Blocks E, F, G, H and J.
- 8.4 The proposed surface water drainage strategy for the Hybrid Planning Application site has been based on sustainable principles with aim to provide a significant betterment to the existing situation. Currently the site does not benefit from any attenuation features and as such surface water run-off flows freely into the adopted sewer network, unrestricted and untreated.
- 8.5 The city center site gives opportunities for “urban types” of Sustainable Drainage Systems (SuDS) features to be incorporated. These features provide water quality and biodiversity betterments and it is proposed that wherever possible, these features will form the wider SuDS Drainage Strategy. The proposals include green roofs, bioretention swales, bioretention tree-pits, lined permeable paving and geo-cellular attenuation devices. These will improve water quality, biodiversity and amenity.
- 8.6 An assessment was undertaken to determine the existing surface water run-off from the site and what flow rate would likely enter the adopted sewer network. The assessment was discussed with Anglian Water and it was agreed that the proposed site should achieve a reduction of run-off to the adopted network to a maximum of 242 l/s to manage all storms up to and including the 1:100yr + 45% Climate Change Event. This will be the equivalent of 43% of the existing 1:1yr surface water run-off rate, a significant reduction.
- 8.7 The development parcels have been split into 9no. drainage catchments. Each catchment has a restricted outfall to the adopted surface water sewer network and attenuation designed to accommodate a 1:100yr + Climate Change Storm Event. Suitable water treatment stages, in line with CIRIA SuDS Manual are proposed and will provide an improvement to the existing situation, where waters enter the adopted sewer network, untreated.
- 8.8 Due to the surface water flood risk within the city of Norwich, it is proposed that the attenuation tanks will have capacity sensors and alarms fitted within them which monitor how full they become during storm events. The attenuation tanks will likely collect run-off from both roof and hardstanding areas and it is not possible to prevent any exceedance surface water run-off flows from off-site from entering the proposed drainage systems. The alarm would trigger in the Anglia Square management office, and it would be the management’s responsibility to distribute the warning to each of the ground floor and retail, commercial and leisure uses. This would allow them time to evacuate, safeguard and close their premises. The flood warning strategy has been discussed further the separate FRA document by Royal Haskoning DHV.
- 8.9 Maintenance of the attenuation features will remain the responsibility of the site owner or an appointed management company. The Anglian Water sewers that pass through the site will remain the responsibility of Anglian Water.

- 8.10 In line with the Four Pillars of SuDS, the proposed surface water drainage strategy, covering 9no catchments, will provide Water Quality, Amenity, Biodiversity and Water Volume benefits/improvements.

### **Anglia Square: Hybrid Application Development Description**

“Hybrid (part full/part outline) application on site of 4.65ha for demolition and clearance of all buildings and structures and the phased, comprehensive redevelopment of the site with 14 buildings ranging in height from 1 to 8 storeys, for a maximum of 1,100 residential dwellings, (houses, duplexes and flats) (Use Class C3); a maximum of 8,000 sqm flexible retail, commercial and other non-residential floorspace (retail, business, services, food and drink premises, offices, workshops, non-residential institutions, community hub, local community uses, and other floorspace (Use Classes E/F1/F2/Sui Generis (public conveniences, drinking establishments with expanded food provision, bookmakers and/or nail bars (up to 550sqm), and dry cleaner (up to 150sqm))); service yard, cycle and refuse stores, plant rooms, car parking and other ancillary space; with associated new and amended means of access on Edward Street and Pitt Street, closure of existing means of access on Edward Street, New Botolph Street, Pitt Street and St Crispins Road flyover, formation of cycle path between Edward Street and St Crispins Road, formation of wider footways, laybys and other associated highway works on all boundaries, formation of car club parking area off New Botolph Street, up to 450 car parking spaces (at least 95% spaces for class C3 use, and up to 5% for class E/F1/F2/Sui Generis uses), hard and soft landscaping of public open spaces comprising streets and squares/courtyards for pedestrians and cyclists, other landscape works within existing streets surrounding the site, service infrastructure and other associated work; (All floor areas given as maximum Net Internal Area);

Comprising;

Full planning permission on 2.25ha of the site for demolition and clearance of all buildings and structures, erection of 8 buildings ranging in height from 1 to 7 storeys for 353 residential dwellings (Use Class C3) (142 dwellings in Block A, 25 dwellings in Block B, 21 dwellings in Block C, 28 dwellings in Block D, 8 dwellings in Block J3, 81 dwellings in Block K/L, and 48 dwellings in Block M) with associated cycle and refuse stores), and, for 5,411sqm flexible retail, commercial and other non-residential floorspace (retail, business, services, food and drink premises, offices, workshops, non-residential institutions, community hub, local community uses, and other floorspace (Use Classes E/F1/F2/Sui Generis (public conveniences, drinking establishments with expanded food provision, bookmakers and/or nail bars (up to 550sqm), and dry cleaner (up to 150sqm))), service yard, cycle and refuse stores, plant rooms, car parking and other ancillary space, with associated new and amended means of access on Edward Street, closure of existing means of access on Edward Street and New Botolph Street, formation of cycle path from Edward Street to St Crispins Road, formation of wider footways, laybys and other associated highway works on Edward Street, New Botolph Street, and Magdalen Street, formation of car club parking area off New Botolph Street, 137 car parking spaces (at least 95% spaces for class C3 use, and up to 5% for class E/F1/F2/Sui Generis uses) within Blocks A and B, hard and soft landscape works to public open spaces comprising streets and squares for pedestrians and cyclists, other landscape works, service infrastructure and other associated works; (All floor areas given as maximum Net Internal Areas);

and

Outline planning permission on 2.4ha of the site, with landscaping and appearance as reserved matters, for demolition and clearance of all buildings and structures, erection of 6 buildings (Blocks E – H and J) ranging in height from 2 to 8 stories for up to 747 residential dwellings, (houses, duplexes, and flats) (Use Class C3), a maximum of 2,589 sqm flexible retail, commercial and other non-residential floorspace (retail, business, services, food and drink premises, offices, non-residential institutions, local community uses and other floorspace (Use Classes E/F1/F2/Sui Generis (drinking

establishments with expanded food provision, bookmakers and/or nail bars (up to 550sqm), and dry cleaner (up to 150sqm)); cycle and refuse stores, plant rooms, car parking and other ancillary space; with associated new and altered means of access on Pitt Street and St Crispins Road, closure of means of access on Pitt Street and St Crispins Road flyover, formation of wider footways, laybys and other associated highway works on Pitt Street and St Crispins Road, a maximum of 313 car parking spaces (at least 95% spaces for class C3 use, and up to 5% for class E/F1/F2/Sui Generis uses), service infrastructure and other associated works (landscaping and appearance are reserved matters); (All floor areas given as maximum Net Internal Areas)."

Wastewater Plan A1

This plan is provided by Anglian Water pursuant to its obligations under the Water Industry Act 1991 sections 198 or 199. It must be used in conjunction with any search results attached. The information on this plan is based on data currently recorded but position must be regarded as approximate. Service pipes, private sewers and drains are generally not shown. Users of this map are strongly advised to commission their own survey of the area shown on the plan before carrying out any works. The actual position of all apparatus MUST be established by trial holes. No liability whatsoever, including liability for negligence, is accepted by Anglian Water for any error or inaccuracy or omission, including the failure to accurately record, or record at all, the location of any water main, discharge pipe, sewer or disposal main or any item of apparatus. This information is valid for the date printed. This plan is produced by Anglian Water Services Limited (c) Crown copyright and database rights 2022 Ordnance Survey 100022432. This map is to be used for the purposes of viewing the location of Anglian Water plant only. Any other users of the map data or further copies is not permitted. This notice is not intended to exclude or restrict liability for death or personal injury resulting from negligence.

## Appendix: I – Anglian Water Approval In Principle

# Pre-Planning Assessment Report

Anglia Square

InFlow Reference: PPE-0143339

Assessment Type: Used Water

Report published: 08/04/2022

Thank you for submitting a pre-planning enquiry.

This has been produced for EAS Transport Planning Ltd.

Your reference number is **PPE-0143339**.

This report can be submitted as a drainage strategy for the development should it seek planning permission.

If you have any questions upon receipt of this report, you can submit a further question via InFlow. Alternatively, please contact the Planning & Capacity team on **07929 786 955** or email [planningliaison@anglianwater.co.uk](mailto:planningliaison@anglianwater.co.uk)

---

## Section 1 - Proposed development

The response within this report has been based on the following information which was submitted as part of your application:

| List of planned developments |              |
|------------------------------|--------------|
| Type of development          | No. Of units |
| Shops                        | 50           |
| Restaurants and cafes        | 25           |
| Dwellings                    | 1500         |

The anticipated residential build rate is:

| Year       | Y1 | Y2 | Y3 | Y4 | Y5 | Y6 | Y7 | Y8 | Y9 | Y10 | Y11 | Y12  |
|------------|----|----|----|----|----|----|----|----|----|-----|-----|------|
| Build rate | 50 | 50 | 50 | 50 | 50 | 50 | 50 | 50 | 50 | 50  | 50  | 1025 |

**Development type:** Brownfield  
**Planning application status:** Unknown  
**Site grid reference number:** TG2302009411

The comments contained within this report relate to the public water mains and sewers indicated on our records. Your attention is drawn to the disclaimer in the useful information section of this report.

## Section 2 - Assets affected

Our records indicate that we have the following types of assets within or overlapping the boundary of your development site as listed in the table below.

Additionally, it is highly recommended that you carry out a thorough investigation of your proposed working area to establish whether any unmapped public or private sewers and lateral drains are in existence. We are unable to permit development either over or within the easement strip without our prior consent. The extent of the easement is provided in the table below. Please be aware that the existing water mains/public sewers should be located in highway or open space and not in private gardens. This is to ensure available access for any future maintenance and repair and this should be taken into consideration when planning your site layout.

| Water and Used water easement information |                |                                       |
|-------------------------------------------|----------------|---------------------------------------|
| Asset type                                | Pipe size (mm) | Total easement required (m)           |
| Water mains                               | 152            | 6.00 m overall easement               |
| Water mains                               | 76             | 6.00 m overall easement               |
| Water mains                               | 102            | 4.50 m overall easement               |
| Water mains                               | 127            | 6.00 m overall easement               |
| Water mains                               | 102            | 4.50 m overall easement               |
| Sewer mains                               | 675            | 6.00 m either side of the centre line |
| Sewer mains                               | 300            | 3.00 m either side of the centre line |
| Sewer mains                               | 225            | 3.00 m either side of the centre line |
| Sewer mains                               | 150            | 3.00 m either side of the centre line |
| Sewer mains                               | 9              | 3.00 m either side of the centre line |
| Sewer mains                               | Unknown        | 3.00 m either side of the centre line |
| Sewer mains                               | 27             | 3.00 m either side of the centre line |
| Sewer mains                               | 7              | 4.50 m either side of the centre line |
| Sewer mains                               | 850            | 4.00 m either side of the centre line |
| Sewer mains                               | 36             | 3.00 m either side of the centre line |
| Sewer mains                               | 24             | 6.00 m either side of the centre line |
| Sewer mains                               | 375            | 3.00 m either side of the centre line |
| Sewer mains                               | 225            | 3.00 m either side of the centre line |

If it is not possible to avoid our assets then these may need to be diverted in accordance with Section 185 of the Water Industry Act (1991). You will need to make a formal application if you would like a diversion to be considered.

Due to the private sewer transfer in October 2011 many newly adopted public used water assets and their history are not indicated on our records. You also need to be aware that your development site may contain private water mains, drains or other assets not shown on our records. These are private assets and not the responsibility of Anglian Water but that of the landowner.

### **Section 3 - Water recycling services**

In examining the used water system we assess the ability for your site to connect to the public sewerage network without causing a detriment to the operation of the system. We also assess the receiving water recycling centre and determine whether the water recycling centre can cope with the increased flow and effluent quality arising from your development.

#### **Water recycling centre**

The foul drainage from the proposed development is in the catchment of Whitlingham Trowse Water Recycling Centre, which currently has capacity to treat the flows from your development site. Anglian Water cannot reserve capacity and the available capacity at the water recycling centre can be reduced at any time due to growth, environmental and regulation driven changes.

#### **Used water network**

Our assessment has been based on development flows connecting to the nearest foul water sewer of the same size or greater pipe diameter to that required to drain the site. The infrastructure to convey foul water flows to the receiving sewerage network is assumed to be the responsibility of the developer. Conveyance to the connection point is considered as Onsite Work and includes all work carried out upstream from of the point of connection, including making the connection to our existing network. This connection point has been determined in reference to the calculated discharge flow and on this basis, a 375mm internal diameter pipe is required to drain the development site. The preferred connection point at manhole 1310 is to a 300mm sewer, that does not have capacity to accommodate the flows from the full development. The foul sewerage system will have capacity for the development if the connection is made over several points across the network surrounding the development site.

In order to assess a suitable drainage strategy and provide connection points, please provide us with a site layout and phasing plan. Anglian water has assessed the impact of gravity flows from the planned development to the public foul sewerage network. We can confirm that this is acceptable as the foul sewerage system, at present, has available capacity for your site.

Please note that Anglian Water will request a suitably worded condition at planning application stage to ensure this strategy is implemented to mitigate the risk of flooding.

It is assumed that the developer will provide the necessary infrastructure to convey flows from the site to the network. Consequently, this report does not include any costs for the conveyance of flows.

#### **Surface water disposal**

In principle, your proposed method of surface water disposal is acceptable to Anglian Water. It is our understanding that the evidence to confirm compliance with the surface water hierarchy is not available. Once the evidence has been confirmed, then a connection point may be made to manhole 1355 at NGR TG 23145 09319 at a rate of 242l/s. Our assessment has been based on development flows connecting to the nearest surface water sewer of the same size or greater pipe diameter. It is your responsibility to provide the evidence to confirm that all alternative methods of surface water disposal have been explored and these will be required before your connection can be agreed. This is subject to satisfactory evidence which shows the surface water management hierarchy as outlined in Building Regulations Part H has been explored. This would encompass the results from the site specific infiltration testing and/or confirmation that the flows cannot be discharged to a watercourse. Anglian Water's surface water policy follows the Surface Water hierarchy, outlined in Part H of the Building Regulations. Should your assumptions or evidence change then an alternative solution, connection point or flow rate may be required.

You are therefore advised to update Anglian Water with the key supporting evidence at your earliest convenience.

As you may be aware, Anglian Water will consider the adoption of SuDs provided that they meet the criteria outline in our SuDs adoption manual. This can be found on our [website](#). We will adopt features located in public open space that are designed and constructed, in conjunction with the Local Authority and Lead Local Flood Authority (LLFA), to the criteria within our SuDs adoption manual. Specifically, developers must be able to demonstrate:

1. Effective upstream source control,
2. Effective exceedance design, and
3. Effective maintenance schedule demonstrating that the assets can be maintained both now and in the future with adequate access.

If you wish to look at the adoption of any SuDs then an expression of interest form can be found on our [website](#)

#### **Trade Effluent**

We note that you do not have any trade effluent requirements. Should this be required in the future you will need our written formal consent. This is in accordance with Section 118 of the Water Industry Act (1991).

#### **Used Water Budget Costs**

Your development site will be required to pay an Infrastructure charge for each new property connecting to the public water and sewerage network that benefits from Full planning permission. The infrastructure charge replaces the zonal charge as previously identified.

You will be required to pay an infrastructure charge upon connection for each new plot on your development site. The infrastructure charge are types of charges set out in Section 146(2) of the Water Industry Act 1991.

The charge should be paid by anyone who wishes to build or develop a property and is payable upon request of connection.

- The Infrastructure Charge is based on the cost of any reinforcement and upgrades to our existing network (“Network Reinforcements”), whether designed to address strategic or local capacity issues. For more information on our Infrastructure Charge, please see the ‘Useful Information’ section of this report.

Infrastructure charges are raised on a standard basis of one charge per new connection (one for water and one for sewerage).

#### **The Water Recycling Infrastructure charge for your dwellings is:**

| Infrastructure charge | Number of units | Total       |
|-----------------------|-----------------|-------------|
| £ 490                 | 1500            | £735,000.00 |

Please note that you should also budget for infrastructure charges on non-household premises where applicable and these will be calculated according to the number and type of water fittings in the premises. This is called the “relevant multiplier” method of calculating the charge and the relevant multiplier will be applied to the figures set out in our 2022-23 Developer Charging Arrangements to arrive at the amount payable. Details of the relevant multiplier for each fitting can be found on our [website](#).

## Section 4 - Map of Proposed Point of Connection(s)

Figure 2: Showing your water recycling surface water point of connection

## **Section 5 - Useful information**

### **Water Industry Act – Key used water sections**

#### **Section 98:**

This provides you with the right to requisition a new public sewer. The new public sewer can be constructed by Anglian Water on your behalf. Alternatively, you can construct the sewer yourself under section 30 of the Anglian Water Authority Act 1977.

#### **Section 102:**

This provides you with the right to have an existing sewerage asset vested by us. It is your responsibility to bring the infrastructure to an adoptable condition ahead of the asset being vested.

#### **Section 104:**

This provides you with the right to have a design technically vetted and an agreement reached that will see us adopt your assets following their satisfactory construction and connection to the public sewer.

#### **Section 106:**

This provides you with the right to have your constructed sewer connected to the public sewer.

#### **Section 185**

This provides you with the right to have a public sewerage asset diverted.

Details on how to make a formal application for a new sewer, new connection or diversion are available on our [website](#) or via our Development Services team on **0345 60 66 087**.

### **Sustainable drainage systems**

Many existing urban drainage systems can cause problems of flooding, pollution or damage to the environment and are not resilient to climate change in the long term. .

Our preferred method of surface water disposal is through the use of Sustainable Drainage Systems or SuDS.

SuDS are a range of techniques that aim to mimic the way surface water drains in natural systems within urban areas. For more information on SuDS, please visit our [website](#)

We recommend that you contact the Local Authority and Lead Local Flood Authority (LLFA) for your site to discuss your application.

### **Private sewer transfers**

Sewers and lateral drains connected to the public sewer on the 1 July 2011 transferred into Water Company ownership on the 1 October 2011. This follows the implementation of the Floods and Water Management Act (FWMA). This included sewers and lateral drains that were subject to an existing Section 104 Adoption Agreement and those that were not. There were exemptions and the main non-transferable assets were as follows:

Surface water sewers and lateral drains that do not discharge to the public sewer, e.g. those that discharged to a watercourse.

Foul sewers and lateral drains that discharged to a privately owned sewage treatment/collection facility.

Pumping stations and rising mains will transfer between 1 October 2011 and 1 October 2016.

The implementation of Section 42 of the FWMA will ensure that future private sewers will not be created. It is anticipated that all new sewer applications will need to have an approved section 104 application ahead of a section 106 connection.

It is anticipated that all new sewer applications will need to have an approved Section104 application ahead of a Section 106 connection

## **Encroachment**

Anglian Water operates a risk based approach to development encroaching close to our used water infrastructure. We assess the issue of encroachment if you are planning to build within 400 metres of a water recycling centre or, within 15 metres to 100 metres of a pumping station. We have more information available on our [website](#)

## **Locating our assets**

Maps detailing the location of our water and used water infrastructure including both underground assets and above ground assets such as pumping stations and recycling centres are available from [digdat](#)

All requests from members of the public or non-statutory bodies for maps showing the location of our assets will be subject to an appropriate administrative charge.

We have more information on our [website](#)

## **Charging arrangements**

Our charging arrangements and summary for this year's water and used water connection and infrastructure charges can be found on our [website](#)

## **Section 6 - Disclaimer**

The information provided in this report is based on data currently held by Anglian Water Services Limited ('Anglian Water') or provided by a third party. Accordingly, the information in this report is provided with no guarantee of accuracy, timeliness, completeness and is without indemnity or warranty of any kind (express or implied).

This report should not be considered in isolation and does not nullify the need for the enquirer to make additional appropriate searches, inspections and enquiries. Anglian Water supports the plan led approach to sustainable development that is set out in the National Planning Policy Framework ('NPPF') and any infrastructure needs identified in this report must be considered in the context of current, adopted and/or emerging local plans. Where local plans are absent, silent or have expired these needs should be considered against the definition of sustainability holistically as set out in the NPPF.

Whilst the information in this report is based on the presumption that proposed development obtains planning permission, nothing in this report confirms that planning permission will be granted or that Anglian Water will be bound to carry out the works/proposals contained within this report.

No liability whatsoever, including liability for negligence is accepted by Anglian Water or its partners, employees or agents, for any error or omission, or for the results obtained from the use of this report and/or its content.

Furthermore, in no event will any of those parties be liable to the applicant or any third party for any decision made or action taken as a result of reliance on this report.

This report is valid from the date issued and the enquirer is advised to resubmit their request for an up to date report should there be a delay in submitting any subsequent application for water supply/sewer connection(s). Our pre-planning reports are valid for 12 months, however please note Anglian Water cannot reserve capacity and available capacity in our network can be reduced at any time due to increased requirements from existing businesses and houses as well as from new housing and new commercial developments.

## Appendix J – Hydraulic Model Outputs

| | 100 year Return Period Summary of Critical Results by Maximum Level (Rank 1) for Storm

Simulation Criteria

Areal Reduction Factor 1.000

Additional Flow - % of Total Flow 0.000

Hot Start (mins) 0

MADD Factor \* 10m³/ha Storage 2.000

Hot Start Level (mm) 0

Inlet Coefficient 0.800

Manhole Headloss Coeff (Global) 0.500

Flow per Person per Day (l/per/day) 0.000

Foul Sewage per hectare (l/s) 0.000

Number of Input Hydrographs 0

Number of Storage Structures 1

Number of Online Controls 1

Number of Time/Area Diagrams 0

Number of Offline Controls 0

Number of Real Time Controls 0

Synthetic Rainfall Details

Rainfall Model FEH
